MAGEE FURNACE CO., Boston, Mass.

Dear Dealer:—Soon after I was born, my parents, the "'Quick Meal' Gasoline and Gas Stoves," outlined what my career should be. They christened me "Quick Meal Steel Range," educated me in the school of "Merit and Success," and started me at the bottom of the ladder.

The place was terribly crowded, and my associates said there was no room for me. Some who had gone up a few Rounds came back in poverty and despair. But I determined to get to the top Round of the "Ladder of Fame," where my parents are. After going up a short distance, there was much more room, and in a little while I stood on the highest point ever reached by any Steel Range.

I am now nearly at the top Round, working for you night and day. I am going to make your Range business large, profitable and satisfactory.

Your Friend,

QUICK MEAL STEEL RANGE,

ST. LOUIS.

THE FORBES WARM AIR FURNACE.

PHILADELPHIA, April 10, 1897.

MESSRS. TUBULAR HEATING AND VENTILATING CO., 228 Quarry Street, Philadelphia.

GENTLEMEN:—The Forbes Warm-air Furnace placed in my house last fall has given me entire satisfaction.

During the greater part of the winter the house had to be kept at a very high temperature, owing to illness in the family. Your furnace did all it was called upon to do, and on a remarkably small amount of coal.

Last winter a furnace of a popular make failed to even warm the house comfortably, and burned fully 50% more coal.

I think your furnace is all you claim for it, and do not hesitate to recommend it to any one desiring comfort and economy. Very truly,

5027 Florence Avenue. M. J. FALLS.

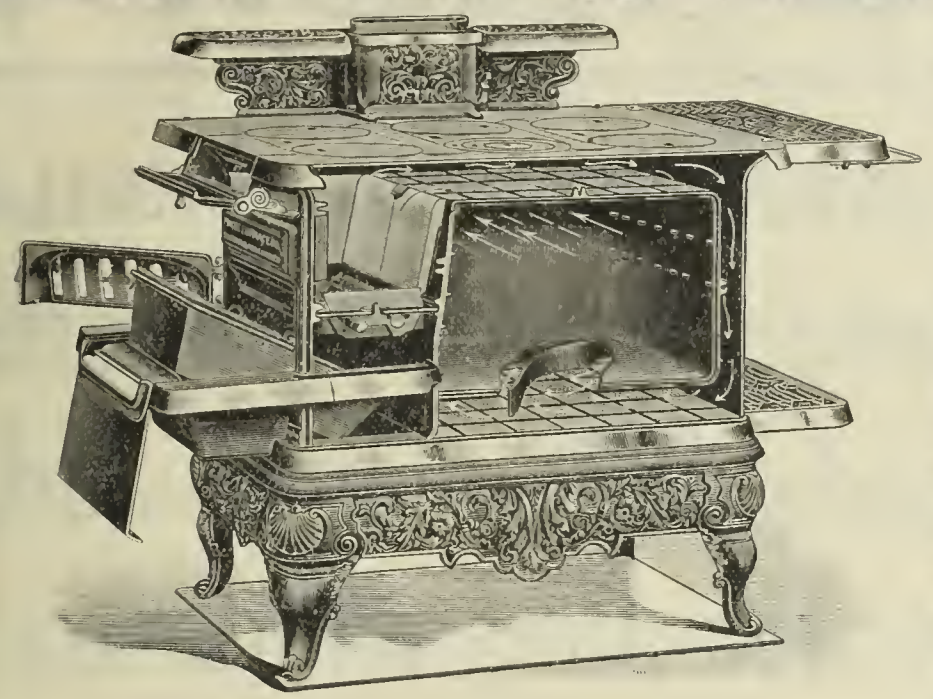
MAGEE "GRAND" MAGEE



Showing interior construction of the Magee Grand Range.

It is the *Best Range* in every particular *that has ever been produced.*

SOME INTERESTING FACTS:

The "Magee" Ranges in their construction differ from all others in having a SHEET-FLUE. Four very desirable objects are gained by this.

1st. A more equal distribution of heat AROUND the oven.

2d. A more equal distribution of heat UNDER the oven.

3d. A more PERFECT system of OVEN VENTILATION.

4th. A DIRECT connection with the chimney.

"Magee" Ranges are the only ones having a FLUE at the BACK of the oven.

It will pay YOU to examine these goods.

Made in all the usual Sizes and Styles, 7-18, 8-18, 8-20 and 9-20.

"There is pleasure as well as profit in selling this range."

REMEMBER the name "MAGEE," and that we have a full and complete line of Ranges, Furnaces, Combination, Hot Water and Steam Heaters, fully warranted. CORRESPONDENCE SOLICITED.

1835 1897

.....SIXTY-TWO YEARS IN BUSINESS.....

The Survival of the Fittest.

For 62 years the Acorn Line of Stoves has been before the trade. During that period numbers of competitors have sprung up and many of them have passed away. The Acorn Line has gone on steadily advancing, always growing in popularity and increasing in sales. It now commands a unique position in the trade.

1st. The oldest Trade-Mark Line of Stoves and Ranges in the world.

2d. The line with the largest number sold and in use in the world.

3d. The largest and most complete assortment of stoves and Ranges made under one name.

The Acorn Line, whilst the oldest in years, is the youngest in enterprise and push.

No old traditions of the musty past hamper the efforts to satisfy the trade.

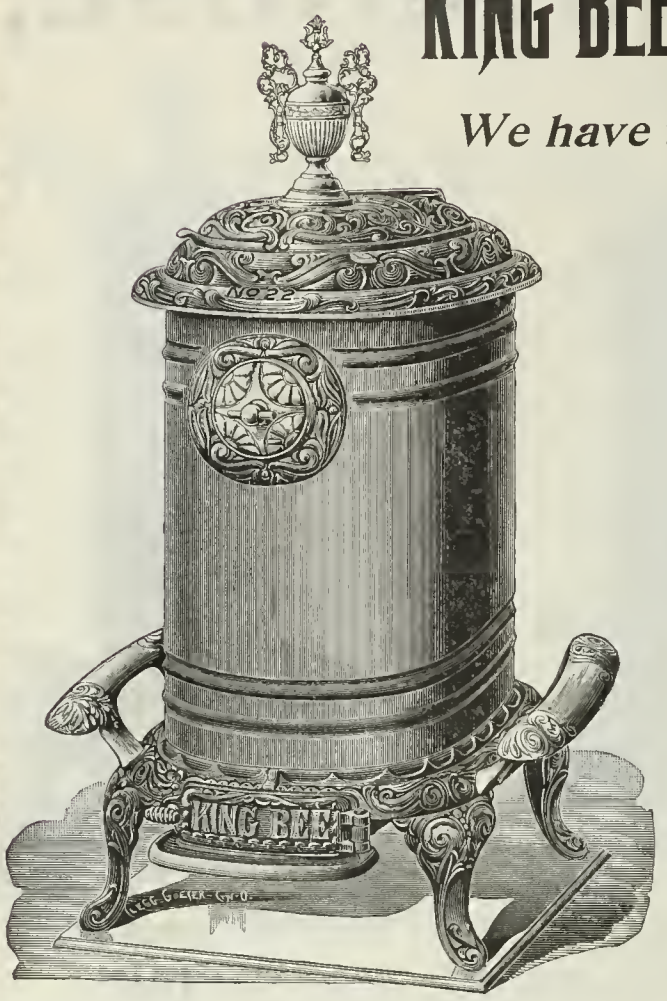
BUCKWALTER STOVE CO., - Roversford, Pa.

KING BEE AIR TIGHT WOOD HEATER.

We have the King Bee of them all.

You can have it if you want it.



The **King Bee** is a striking example of the motto "Not How Cheap, but How Good," and yet the price is kept within the reach of all.

The **King Bee** has cast top and base, with deep ash pit, has air tight ash door in base and handsome nickel foot rails and urn. Cast swing top and inside swing cover.

It has our patent down draft hot blast flue, which heats the air to a very high temperature before entering the stove, and which has made our Peoria Base heating stove so popular and salable.

To this down draft a patent screw register is attached, which will never get out of order and which controls the draft perfectly.

The **King Bee** is mounted with Wood's Best Planished Russia Iron No. 26 and lined with best refined iron No. 20. There is a space left between the outer body and lining which prevents heating red hot.

We also mount the stove when desired in cheaper form, with smooth sheet steel; but the difference in price is poor economy.

Do not buy a stove with a single steel body, as they soon discolor. Get the double body **King Bee** mounted in the best form and you will make no mistake. We make three sizes, No. 22, No. 25 and No. 28.

Write for prices and order sample at once to compare with others.

CULTER & PROCTOR STOVE CO., - Peoria, Ills.

Monarch Blue Gas Flame Oil Heating Stove.

The phenomenal success of the "Blue Flame" Oil Burner of the past two years has created a "Macedonian Call" for a heater made on the same lines, and the "Monarch" steps forward to supply the demand. It has been on the market one year, and for the season of 1897-8 is presented with several important improvements which a year's experience has suggested and we offer it with all confidence in its efficiency, cleanliness, intense power and great comfort.

There are no others with Blue Flame.

Top tilts back to light the Burner or to remove the Tank. Mounted on Casters. The entire Stove is richly nickeled and beautifully polished. Brass Tank. Burner cannot creep up. Will not smoke or smell. There is only one "Blue Flame" Heater and that is the "Monarch."

WRITE FOR PRICES AND TERMS.

DANVILLE STOVE & MFG. CO., Danville, Pa., New York, N. Y., and Phila., Pa., Agents for Eastern States.

Hamilton Oak.

No stove has ever been made that has given such universal satisfaction as the **Oak Stove, if properly constructed.**

But in order to be properly constructed, it shonld first be absolutely air-tight; therefore, in order to have a stove absolutely

Air-tight, Gas-tight and Fire-keeping,

it must be made with a **Jointless Base,** and registers that can be closed absolutely tight, and made in such a manner that they remain tight.

We are now making, under several patents, **a Base without any Joints,** that has a large ash-pan and patent screw registers; and in order to throw the heat to the floor, we use **a broad deflecting Pot Ring,** which is a new and desirable feature.

Examine carefully our **Patent Anti-Buckling Ring.** The greatest invention of the age for Oak Stoves.

In the **Hamilton Oak,** with Sqnare Base, we have embodied all these essential features, and have prodnced the **best and handsomest Oak Stove** in the market, and at a moderate price, considering the increased cost of this stove.

Satisfaction Guaranteed.

Time Tried and Fire Tested.

We make other stoves, too. Send for our complete catalogue. . . .

BRICK SET "Plummer" STEAM HEATER "New Model."

Cut shows Boiler and how it is put together, from Ash Box to Steam Dome. Arrows show in which direction fire must travel to reach chimney.

A large amount of available heating surface, which can be easily reached and kept clean, makes it a very *powerful heater.*

Every boiler tested 60 lbs. cold water pressure and warranted free from imperfections. The Plummer has stood the test as an economical and practical *house warmer* for 12 years.

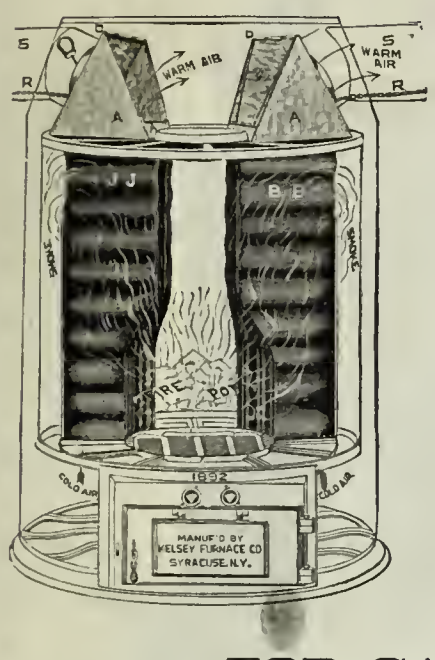
Other Heater Men

Assured him it could not be accomplished with

Warm Air.



C. H. DAVID,
ATTORNEY AND COUNSELLOR AT LAW,
FULTON, N. Y., March 23, 1897.

Gentlemen:—We have used a Kelsey Generator in our house for five winters, with great satisfaction, and find it easy to manage, and economical. With a moderate amount of coal, it gives our whole house, of nine good-sized rooms, besides the hall, an agreeable and reliable heat in the coldest winter weather. By the ***Positive Attachment*** on this heater, it sends the heat into our dining room, through a level pipe twenty-five feet, a feat which other heater men told me could not be accomplished with warm air. Last fall I ordered a second "Kelsey Generator" for another house.

Very truly yours,
C. H. DAVID.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

Sent Post-paid on receipt of Price by

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

AVOID MISTAKES AND LOSS
BY USING THE
CONTRACT and ESTIMATE RECORD BOOK FOR PLUMBERS.

By B. H. JESSUP.

OFFICE EDITION. (Second Enlarged Edition) 200 Pages. Arranged for 100 Estimates, size 9 x 12 inches, cloth, $2.00.

POCKET EDITION. 200 Pages. Arranged for 50 Estimates, size 3½ x 8 inches (oblong), flexible, cloth, $1 00

Plumbers will find the use of the Contract and Estimate Record Books a great saving in money and time.

These carefully prepared books offer a means of recording systematically and with little trouble each estimate or contract and will be of especial value to the trade because they give all the items in connection with each estimate, by which the danger of omission and error is avoided.

Each book contains a list of all material likely to be used in any ordinary house, and parallel columns give space for entering the cost.

OFFICE EDITION.

This edition is specially adapted for desk use The improvements and additions now introduced make this a perfect estimate book.

An alphabetical index is given in the front of this book for entering the names of those for whom estimates have been furnished, together with the number of the page on which the estimate is to be found in detail.

POCKET EDITION.

This book is printed on thin, strong paper, and arranged in the most compact and handy form for pocket use.

At the beginning of each form is a space for the name of the person for whom the estimate is made, and the date.

Plumbers will be well repaid who depart from old or imperfect methods of keeping track of work, and take these books into their shops for practical use.

Sent, prepaid, on receipt of price by

—How to Lie In a Sleeper.—The following story, as told by Eli Perkins, has been going the rounds lately: "I rode one day on a train with Mr. Evarts. We were talking about riding on the Wagner, and I said: 'Now, Mr. Evarts, you have ridden a good deal on the sleeper, and how had a man better lie to sleep well? Head to the engine, or feet toward the engine?'

" 'Oh, you shouldn't come to a lawyer with such questions as that, Eli. That isn't a law question; that is an engineering question. You should go to some railroad president with such a question. Go and ask Depew.'

" 'But Depew is a lawyer, isn't he?' I said.

" 'Well, y—e—s! Depew is a lawyer;' then, continuing slowly and thoughtfully, 'but all the law Depew knows wouldn't bias him in answering any question.'

"When I told this story at the Lotos Club, a week afterward, Depew happened to be there. He laughed with the rest, but just before he left he leaned forward with his hand over his mouth and whispered to me:

" 'The story is all right, Eli; but if you won't tell it any more in New York I'll give you an annual on the road.' "

Mr. Depew's sequel to this story is that when Perkins came into his office and propounded the question to him he said:

"It would not make any difference to you, Eli, whether you were lying with your feet to the engine, or your head; you would lie just the same."

"See here!" howled the manager, "does it take you four hours to carry a message three streets away and return?"

"W'y," said the new office boy, "you told me to see how long it would take me to get there and back, and I done it."—*Tit-Bits.*

PATENT PENDING.

DIRECTIONS FOR USING.

Place the arms 3 in flue hole, leaving lugs 5 and ring 1 close to outside surface of chimney. Insert stovepipe as usual. As stovepipe enters flue hole, lug 5a catches on inner surface of chimney. Turn thumbnut 8 until ring 1 is tight around pipe. Push collar to accustomed place and the entire lock is out of sight.

Packed, 1 doz. in nicely labeled box.

Send in your orders at once. Set the pace rather than follow the other fellow. The cost is but a trifle.

No more cussing on account of stovepipe.

Sole Mfr.,

Box B, Winfield, Kans.

—A BULL fight was recently given in the City of Mexico, in honor of the party of visiting American editors, and as a compliment to them the placards announcing the event were printed in what was thought to be English, as follows:

BUCARELI PLEACE OF DOWELS.

Greatest bull-baiting for the afternoon of Sunday 28 of February 1897th at 3 o'clock presily

There were beadering

6—BULLS FOR TO KILL—6

and one Spaniard of which was piked and put in beonderillyah three very good killers.

Very down prices.

Seen the programs.

—*New York Tribune.*

—THE Philadelphia *Record* tells this story of a trade war. In order to boom business an enterprising grocer on a certain day advertised several thousand five-cent loaves of bread for sale at one cent each. His rival was in despair until a brilliant idea came into his head. He hired a small army of boys and girls to buy up all the loaves at a cent each. At 2 o'clock Grocer No. 1 had sold all his bread, and those who came later denounced him as a fraud, who had fooled them with a lying advertisement. Meanwhile the foxy grocer around the corner, with more than a thousand one-cent loaves stacked up on his kitchen floor, put out a big sign: "Fresh Bread—A Five-Cent Loaf for Two Cents. We Never Advertise What We Have Not Got." He thus not only discomfited his rival and turned the tide in his own favor, but made a profit on the bread as well.—*New York Tribune.*

Cleveland, O.

—She Didn't Tumble, Though.—A short time ago an old lady went on board Nelson's flagship, the Victory. The different objects of interest were duly shown to her, and on reaching the spot where the great naval hero was wounded (which is marked by a raised brass plate), the officer remarked:

"Here Nelson fell!"

"And no wonder!" exclaimed the old lady. "I nearly fell there myself."—*London Answers.*

"I see there has been a machine patented which records every time a man moves," said Juniper.

"Well, it would put the machine to a pretty good test if it was tried on some of my tenants," said Flatte, the landlord. —*Yonkers Statesman.*

—Real Scotch Banter.—Charles A. Cooper says that when he was on the staff of the Scotsman he one day went to the room of his chief, Alexander Russel. As he opened the door the light must have struck strongly upon his hair, fast turning gray. Mr. Russel, who was bald, put up his glasses and exclaimed:

"Man, Cooper, how white you're getting!"

Cooper passed his fingers through his hair and replied:

"At any rate, there's plenty of it."

"Oh," came the retort, "mine preferred death to dishonor!"

—I won't stay long," ejaculated the six-footer, as he was about to have both legs amputated.—*Exchange.*

HE SELLS THE "WAGNER"

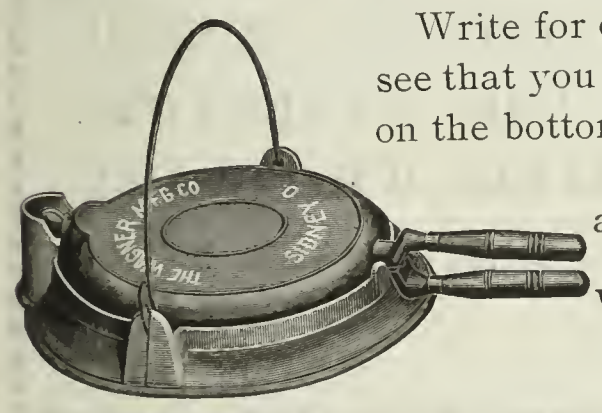
WAFFLE IRONS

And "Wagner" Iron and Nickel Plated Hollow Ware, the Highest Grade in the market.

Since the "Wagner" Waffle Iron has been put upon the market delicious waffles may be had without any more labor than is required to make griddle cakes of any description. They are conveniently operated and cleaned, as the pans separate at the hinge. This feature is entirely original in the "Wagner" Waffle Iron and is fully protected by patents. They are highly endorsed by Mrs. S. T. Rorer, Principal of the Philadelphia Cooking School, and many other demonstrators in cookery. We have customers that retail over ONE THOUSAND Waffle Irons per year.

This man does not.

Write for copy of our new catalogue. Always see that you get ware with the name "Wagner" on the bottom.



Ware sold from this market under any other name is not our make.

Wagner Manufacturing Co.,

31 to 61 Stone St., Sidney, Ohio.

EVERY HARDWARE MERCHANT

will find valuable suggestions for the advantageous arrangement and display of hardware in

The American Hardware Store,

By R. R. WILLIAMS, Hardware Editor of *The Iron Age*. 450 Pages. 500 Illustrations. Price, $3.00.

The Business Situation.

The third quarter of 1897, just closed, will be written down in trade annals as an era of pronounced revival. Business, which was hopefully recovering three months ago from the maladies which had sapped its vitality during nearly four years of depression, has renewed its strength to an extraordinary degree. The tonic of restored confidence has stimulated commercial and industrial activity all along the line and the opening of the last quarter of the year sees the trade of the country fairly launched on a new career of prosperity. Falling prices, disheartening competition, production running far ahead of consumption, and profits shrinking to the vanishing point—all the untoward features which made the last few years so burdensome to business men are happily becoming things of the past. A spirit of cheerful confidence has taken the place so long occupied by uncertainty and pessimism. The great agricultural community is blessed by bountiful crops, which the farmers are able to sell at profitable prices, and the good money which is flowing into their pockets is gradually finding its way again into the accustomed channels of trade. The expanding consumptive demand for manufactured goods of all kinds is reflected in renewed activity among mills and factories, which means more wages to an increasing body of workers who, in turn, are spending their money with greater freedom in various directions to the profit of trade in general. The railways are making up in a vastly increased freight business for their former losses, and are investing their growing earnings largely in improvements, repairs and renewals, thus throwing a heavy business to the iron and steel mills and in other directions, all of which entails a material swelling in the ranks of employed labor. The improvement, so far, has reached its highest development in the States west of the Mississippi, where the agricultural interests are the strongest. But it is also quite marked in the Eastern and Central States and in the South, except where the yellow fever outbreak has imposed a check on business lately. Prices are tending upward in an increasing number of lines. In several cases they are substantially higher. Production has fallen in the rear of the consumptive demand in a number of instances, notwithstanding that the manufacturing capacity is being pushed to its utmost degree to fill orders. The aggregate of bank clearings in the United States, a very reliable gauge of the volume of business, has for several weeks past reached totals of from $1,100,000,000 to $1,400,000,000, showing a gain of 50 to 60 per cent. over the figures of a year ago, and being 15 to 18 per cent. heavier than the totals for 1892, the last previous year of real trade activity. Exports continue unusually heavy, both in agricultural and manufactured products, and the foreign trade balance is steadily rolling up in our favor to unprecedentedly large proportions. In short, the last quarter of the year opens with the brightest outlook that the business world has been privileged to see for years past. At the moment there is a kind of "between seasons" lull in trade, but merchants and manufacturers generally are cheerfully preparing for an unusually brisk winter and spring campaign.

A Nut Cracked.

A hard question was asked last winter which is now being answered. When it was asked, those who propounded it were of the opinion that a long time would elapse before a satisfactory solution should present itself. The cause of our great prosperity in the past was traced to the enormous amount of money invested year after year for practically a generation in railroad building, extensions and improvements, ranging from a hundred to even five hundred million dollars per annum, and the question propounded was from what source are we to expect any great increase of wealth to the nation, to take the place even temporarily of the investment in railroad securities? An unexpected shortage in foreign crops and an abundant supply in this country have furnished the essentials for solving the problem. The foreign demand has proved a strong enough lever to lift us out of the rut of business depression, and if we are wise enough to use our good fortune with moderation we will be able to get along nicely in the years to come when the foreign demand will be light.

The Building Situation.

During the past sixty days indications of renewed prosperity and activity in the building trades throughout the country, which were more or less vague in the earlier season, have become crystallized actualities. The proportion of increase in the amount of money invested is larger through the Middle and Middle Western States than it is in the extreme East. It is estimated that the total amount invested in building during 1897 in the large cities of the East will exceed to a marked extent the amount invested during the previous year, but the proportion of increase seems to be greater in the West owing to the unusual dullness of business during 1896 in that section. Building is becoming more active as the season advances in the smaller cities throughout the country generally, a movement which is arousing hopeful anticipations, and is also manifesting itself in the cities of the extreme West and Rocky Mountain district. Very little disturbance has occurred during the past month between employers and workmen, the only strike of special significance being that of the cornice and skylight makers, which began on September 7 in New York and adjoining cities.

THE LETTER BOX.

Paint for Galvanized Iron.

From Manufacturer, Pennsylvania.—We notice the inquiry of "Tinner," Troy, Ohio, in *The Metal Worker* of September 25. The question he brings up is an important one, and while we have painted acres of galvanized iron we are unable to determine absolutely the best paint for the purpose. We have excellent results from the Nobrace, which is a carbon paint ground in oil, having wonderful covering qualities and adhering firmly. We have also used graphite paint for this purpose which was quite satisfactory, also red lead paints.

From a Bro. Chip, Jersey City, N. J.—Having read a letter from "Tinner," Troy, Ohio, complaining about paint not adhering to galvanized iron, cornices and roofing, would tell him we have had the same trouble, not only on galvanized iron work, but also on tin roofing. We have used paints of various manufactures, and also various kinds, and invariably with the same results. In some cases the paint would chip or crack, and in other cases the paint would evaporate so that hardly anything could be seen of it in a short time after its application, to the great annoyance of our customers and detriment of ourselves, as our customers would charge us with using poor materials. Now we believe that we have obviated all this difficulty by grinding and mixing our own paints, using the best mineral paints and oil that we can procure. Since we have done so we have had no trouble whatever, therefore we believe if "Tinner" of Troy, Ohio, will see that he has first-class paints to cover his work with he will have no trouble. Of course if "Tinner" persists in using the cheap concoctions sold as paint in the market he will have no end to his troubles.

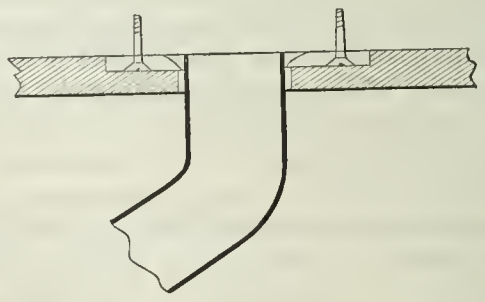
From Joseph Dixon Crucible Company, Jersey City, N. J.—On page 56 of *The Metal Worker* of September 25 you say that you would be glad to have those who are interested in the matter of painting on galvanized iron write to you about their experience, so that you may present them in the Letter Box. We have quite a large galvanized cornice on the street side of our pencil factory. It is 40 feet on the side street and 175 feet on the main street. When it was put up, about six years ago, it was painted with Dixon's silica graphite paint, and it has not been repainted since and it is in perfect condition. When the paint was applied the painter took care to note that the galvanized iron was free from any paraffin grease or oil, which is so often found on galvanized iron. Where it did appear to be at all oily or greasy that portion he washed with a weak solution of ordinary washing soda. Two good coats were applied and the job has been, as above shown, eminently satisfactory.

From N. Y. C.—I notice the inquiry from "Tinner," Troy, Ohio, in *The Metal Worker* of September 25, and I am not surprised at the complaint he makes. There is apparently something about the zinc coating that interferes with the sticking of the paint. The same trouble will be found with painting sheet zinc, but of course that complaint does not often arise, as there is comparatively little occasion for covering sheet zinc in this way. I have used iron oxide paint ground in oil, half raw and half boiled, and found that it gave very fair results. The complaint is sometimes made, where ready mixed paints are used, that the paints are adulterated with benzine or some such light fluid, which evaporates and leaves no body to stick to the sheet, and this is pretty bad with galvanized iron. Where a concern use a great deal of paint it is sometimes desirable for them to get their own paint grinding machine and mix the paints up for themselves. Of course a small user of paint could not afford to buy one of these grinders. I have also had fairly good results from the use of graphite paint. I doubt if your correspondent will have his question satisfactorily answered, as the difficulty, I am sure, lies in the material which he wishes to paint, which always has and always will give trouble.

Setting Siphon Jet Water Closet.

From T. R., Lowell, Mass.—When I first read the inquiry of "W. F. S.," in *The Metal Worker*, September 11, I thought that it was a rather simple job, not worth writing about; but when I reflected how I learned to do it I concluded to tell him what I knew about it. My knowledge was about the same as his at the start, because I had always been kept busy running lead service pipe. I read *The Metal Worker* and found in it at different times brief accounts of the latest practice and the objections raised against what was the general custom.

Assuming that one closet is to be placed in the bathroom of a private house, with only the bathroom fixtures



Setting Siphon Jet Water Closet.

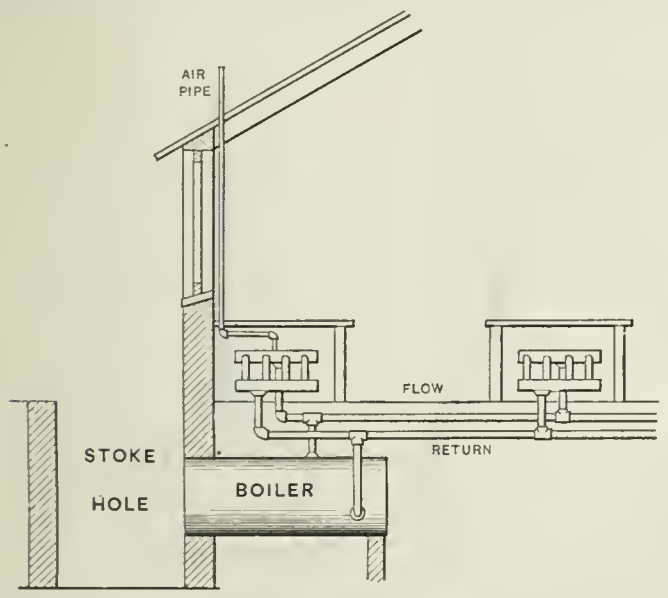
on that stack, the stack should be run up through the roof so that the part above the fixtures may be used for ventilating the traps. In selecting the Y which must be put in the stack to receive the closet waste, it must be decided whether the bath and lavatory waste are to be connected to a separate opening, as special Y's are now on the market adapted to this method, which represents the best practice. In determining just where this Y must be placed, the workman must know whether a marble slab is to be used under the closet, and if the bathroom floor is to be concreted or made of matched flooring, and also the depth of the joists. As there is a trap contained in the vitreous ware closets it is only necessary to provide a lead bend to connect the closet with the Y, but this connection is the most important part of the work, for if it leaks water and filth it is a nuisance, and worse yet if it leaks the filthy air of the house drains and possibly air from the sewer. No more need be said to show that this connection must be made with conscience as well as with the usual plumbing materials.

At one end of the lead bend a heavy brass ferrule should be connected by a stout wiped joint and then securely calked into the Y. At the other end of the bend a brass floor flange should be attached by a good soldered joint, as shown in the sketch, care being taken to thoroughly tin the bevel edge of the countersunk floor flange before attempting to do the soldering. Bolts are furnished for fastening the earthen part down tight to the flange. In order to make the joint tight some use a rubber gasket that is said to be pure, but it does not remain undefiled long if used. I prefer a good red lead putty, for it has the property of lasting indefinitely.

Owing to the trouble with broken vent horns on all earthen closets I prefer venting the trap by means of a branch at the lead bend. This takes an obstruction out of the bathroom, and if this branch is carefully made there is little danger of its being choked. The other end should be carried up to a sanitary T placed in the stack above the highest fixture. I like a rubber connection on the flush pipe, as then there is no danger of breaking the horn. Get dimensions of the closet from the dealer and measure the place where the work is to be done, so that a working drawing of the whole job can be put on paper in plan and elevation before the work is commenced, and I will guarantee that you will make a success of it on the first attempt. Then, after you are through, just be good and generous enough to tell how you got along, and criticise anything I have advised, for I won't feel bad.

A Greenhouse Heating System.

From W. M., Staten Island, N. Y.—With reference to the plan and cross section of a greenhouse showing system of heating about which "W. M. C.," San Jose, Cal., asks information in *The Metal Worker*, March 6, I would like to say that the system would, no doubt, work and probably give the desired results. There are, however, a number of changes in details that will make the



A Greenhouse Heating System.

system all right. The first of these is the position of the boiler, which should be sunk low enough to allow the main flow pipe to come out of the top of the boiler just below the level of the floor. Then one main flow pipe is sufficient, instead of three of them as shown on the plan which he furnished. The main flow pipe, and also the flow pipes which branch from it, should be laid with the rise as stated, and if the return pipes are laid parallel they will have the same fall back to the boiler, which is all that is required. The correspondent shows the air pipe discharging into the expansion tank; but this is unnecessary. As this is a low pressure system all that will be discharged from the air pipe will be air, and consequently had better be taken direct through the roof at an elevation above the expansion tank. There should be three air pipes, however, one from each of the three separate rows of piping which are shown on the plan. The air pipe should be taken from the highest point of the flow just before it becomes the return, as the air naturally rises to the highest point. An air cock will answer the same purpose, and it does away with the necessity of air pipes, but in my judgment the pipes are best.

As to the quantity of piping, the correspondent shows three rows of four flow and four return pipes each, which would make about 1440 feet of pipe. Now 1 lineal foot of 4-inch pipe, which is the usual size employed in low pressure heating, will heat 70 cubic feet of space to the desired temperature, and as 4-inch pipe offers two and a half times the radiating surface of 1¾-inch pipe, there would be required for this house abont 578 lineal feet o 1¾-inch pipe. Still it is well to have an ample margin so as not to force the boiler, and I think that just half the quantity shown by the correspondent would be amply sufficient. The inclosed sketch which I send shows how I would arrange the boiler and pipes. If the correspondent desires any further particulars I shall be very glad to communicate them.

Pattern for a Two-Pronged Fork.

From A. S. R., De Kalb, Ill.—Please publish in *The Metal Worker* method for obtaining section on miter or joint line between two forks of a Y, or two-pronged fork, so I may obtain the pattern by triangulation. I wish an accurate method that will apply in either of the inclosed sketches. The method published in the issue of March 28, 1896, shows only a freehand drawing for the intersection line, which I do not think is accurate.

Note.—We have not reproduced our correspondent's sketches, which show the intersection of two conical shaped forms, or rather a fork, the lower opening of which is a circle, and both of the branches opening at the outer ends in circles. Speaking roughly, the two pipes making the fork are cones, but our correspondent will understand that they cannot be true cones if they form a circle where they meet at the base. Therefore, being irregular forms, it is impossible to determine accurately what the miter line will be. The metal will have to be brought out of its true form of a cone to meet the miter. The only thing to do, therefore, is to proceed as was stated in the answer to the inquiry in *The Metal Worker* of March 28, 1896: "It is a question to be decided by the pattern cutter whether it is possible to draw this line arbitrarily in plan, and from it develop a section on the line B C, or to establish arbitrarily a section on the line C G similar to that shown at the right in $W^1 K^1 Z^1$. As this section must be established arbitrarily in one view or the other it can more satisfactorily be accomplished from the elevation than from the plan view."

What Commission for Selling Tinware?

From Tinware Salesman, Pennsylvania.—I shall be glad to learn from *The Metal Worker* or its readers what commission is paid for selling tinware to a salesman traveling through the country with a horse and buggy and defraying his own expenses. This method of selling goods has not entirely gone out of use, and I think it is employed with benefit in different sections of the United States, and I am desirous of learning what compensation could reasonably be expected.

Statistics of the lead and zinc production of the United States for 1896 have just been published by the Geological Survey. They show that lead mining was more active last year than at any former period, the output being ahead of the figures for 1891, the previous "banner year," by 10,000 tons. The total product of metallic lead in 1896 is given as 264,000 tons. Of this quantity, however, 78,000 tons were refined from foreign ores, leaving but 188,000 tons as the genuine American product. Manufactured lead of domestic production was exported last year to the value of $607,000, which is the highest figure ever reached in this branch of foreign trade. Spain is the only country that exceeds the United States in the matter of lead production, her output last year being 190 tons more than was produced here. Zinc production fell off from 89,000 tons in 1895 to 81,000 tons in 1896, this industry sharing in the general business depression to a larger extent than lead. Brass manufacturers were far from busy, and the galvanizing industry was dull, while sheet zinc did not call for normal requirements.

The annual report of Supervising Inspector-General of Steam Vessels Dumont shows that approximately 650,000,000 passengers were carried on steam vessels during the year, and that the number of accidents resulting in loss of life was only 26. The average annual loss of life during the past 20 years has decreased to a remarkable extent since the system of steam vessel inspection has been operative. Thus in 1851 it was one life to 156,006 passengers carried, whereas it has now sunk to the loss of only one life to each 1,882,845 passengers carried.

SHEET METAL WORK.

SLATE AND COPPER ROOFING ON FIRE PROOF BUILDINGS.—II.

BY WILLIAM NEUBECKER.

JOINING COPPER MOLDING TO STONE WORK.

Fig. 9 shows the method of fastening molding to stone work in a water tight manner, the molding forming a gutter under a mansard roof which is connected to a cast iron pipe on the inside of the building. A is the brick wall and B the stone coping, with a groove, C, cut into it the entire length of the molding. D represents ½-inch holes 1 inch deep, drilled into the coping at intervals of 2 or 3 feet. E is the molding with flange bent outward at F and set into the groove, which is filled with molten lead.

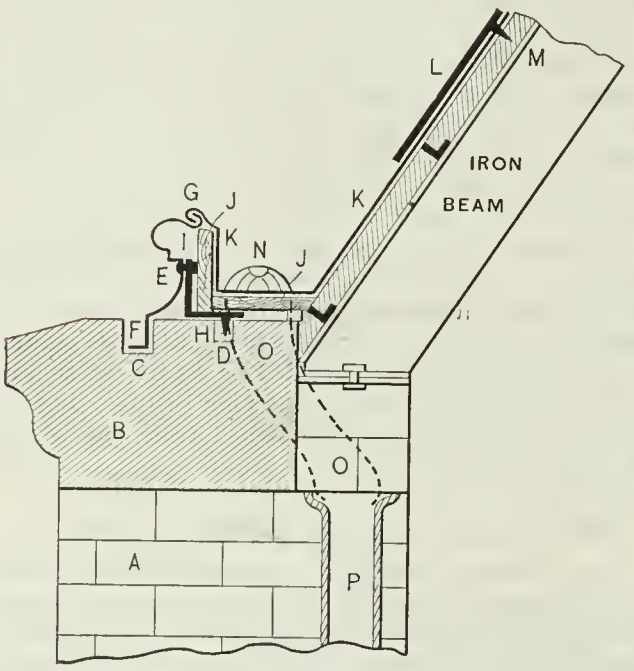


Fig. 9.—Method of Fastening Molding to Stone Work, Forming Gutter and Connecting Tube.

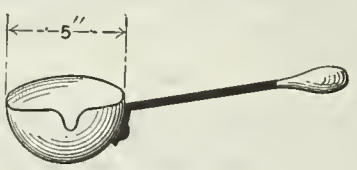

Fig. 10.—Ladle for Casting Lead.

The brass brace I I, which has been previously fastened to the copper molding by the brass bolt at E, is now fastened by means of brass nails into the drilled hole D in the stone, which has previously been plugged with lead.

The molding being set plumb, the gutter is then lined by the carpenter with planks J J, after which it is lined with sheet copper, locking the same into the lock G at the top and extending up against the porous terra cotta roof, as shown by K. Care should be taken to extend the copper lining high enough so that in case of an overflow the water will not flow behind the lining. Over this lining the slates L are laid and fastened to the terra cotta by means of brass nails. On some buildings the rain water is carried off by cast iron pipes, run up on the inside of the building in recesses left by the mason. P in Fig. 9 represents a cast iron pipe, put up by the plumber but connected by the roofer, by means of a 20-ounce copper tube, O O, connected with the copper gutter at the top with a copper strainer, N, and connected to the iron pipe P by means of a brass furrule soldered to the copper tube and calked to the iron pipe. Where the copper tubes pass through the stone or brick work it is usual for the stone-cutter or mason to make the necessary openings.

TOOLS REQUIRED FOR JOINING COPPER TO STONE.

A plumbers' furnace and pot are first required in which the lead is melted, and as it is important to pour as much molten lead into the stone groove as possible at one time a 5-inch ladle is usually employed of the shape shown in Fig. 10. After the groove has been filled with lead and has cooled it will be necessary to calk it well into the groove with calking chisels, the full size measurements of which are shown in Fig. 11. They are made of octagon steel and forged to the shape shown.

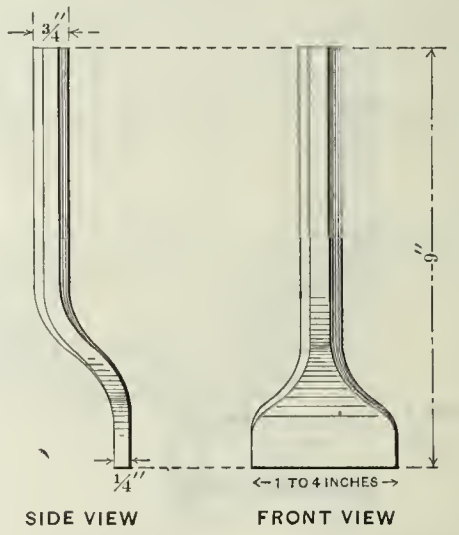

Fig. 11—Calking Chisel.

Fig. 13.—Soldering Copper Leader Inside.

CONNECTING TUBE TO ORNAMENTAL GARGOYLE.

Fig. 12 is a sectional view of a parapet wall, showing method of connecting tube to gargoyle and roof and obtaining water tight joint between the copper flashings and stone work and roof.

A is an iron column with shoulder upon which the iron roof beams rest, as shown at B. The columns are inclosed with stone and brick work and the space between roof beams is filled with brick arches. In this case a planked roof is laid, on which sheet copper is placed. C represents the wood furring, F the roof planks and D the copper covering, which is flashed up against the brick and stone work and made water tight into the groove H. In this case a square copper leader is to be placed on the outside of the building and secured to the stone work by ornamental hinged wrought copper hooks or holdfasts. For ornamental purposes a gargoyle is placed over and connected to the leader by means of tubes. K represents the copper tube connected at the top to the roof line D and flashing E, as shown, and at the bottom having a Y branch,

one branch connecting to the leader L and the other through the mouth of the gargoyle at M. A sheet metal stop, Y, is placed at the intersecting point of the Y branch, so that in case of a heavy rain the water rushing through the tube K will not overflow through the branch M while the leader is open. Should the leader, however, be frozen shut in the winter and the ice begin to thaw on the roof the water will overflow through the branch at N. A hinged strainer is shown at J, which is fastened to the flashing E and can be raised when desired for cleaning purposes. The leader L is fastened to the stone work in front with copper fasteners as before mentioned. The fasteners are placed about 8 feet apart and holes drilled into the stone work ½ inch in diameter by 2½ inches deep and plugged with lead; the hooks are then nailed in place by means of copper nails 2½ inches long with round heads.

CONSTRUCTION OF THE LEADER FASTENERS.

The leader fasteners are usually made from ¼ x 2½ inch band copper with an ornament at the ends, through the center of which a hole has been punched to admit the nail for fastening to wall. The construction of the hook is shown in Fig. 12. Let R represent the square leader projecting from the wall line S as much as shown. The hook is made of band copper as before mentioned in four pieces. The front is shown by X X hinged at one corner, the pin in the opposite corner being removable to allow the front to open and close. The two sides are separate;

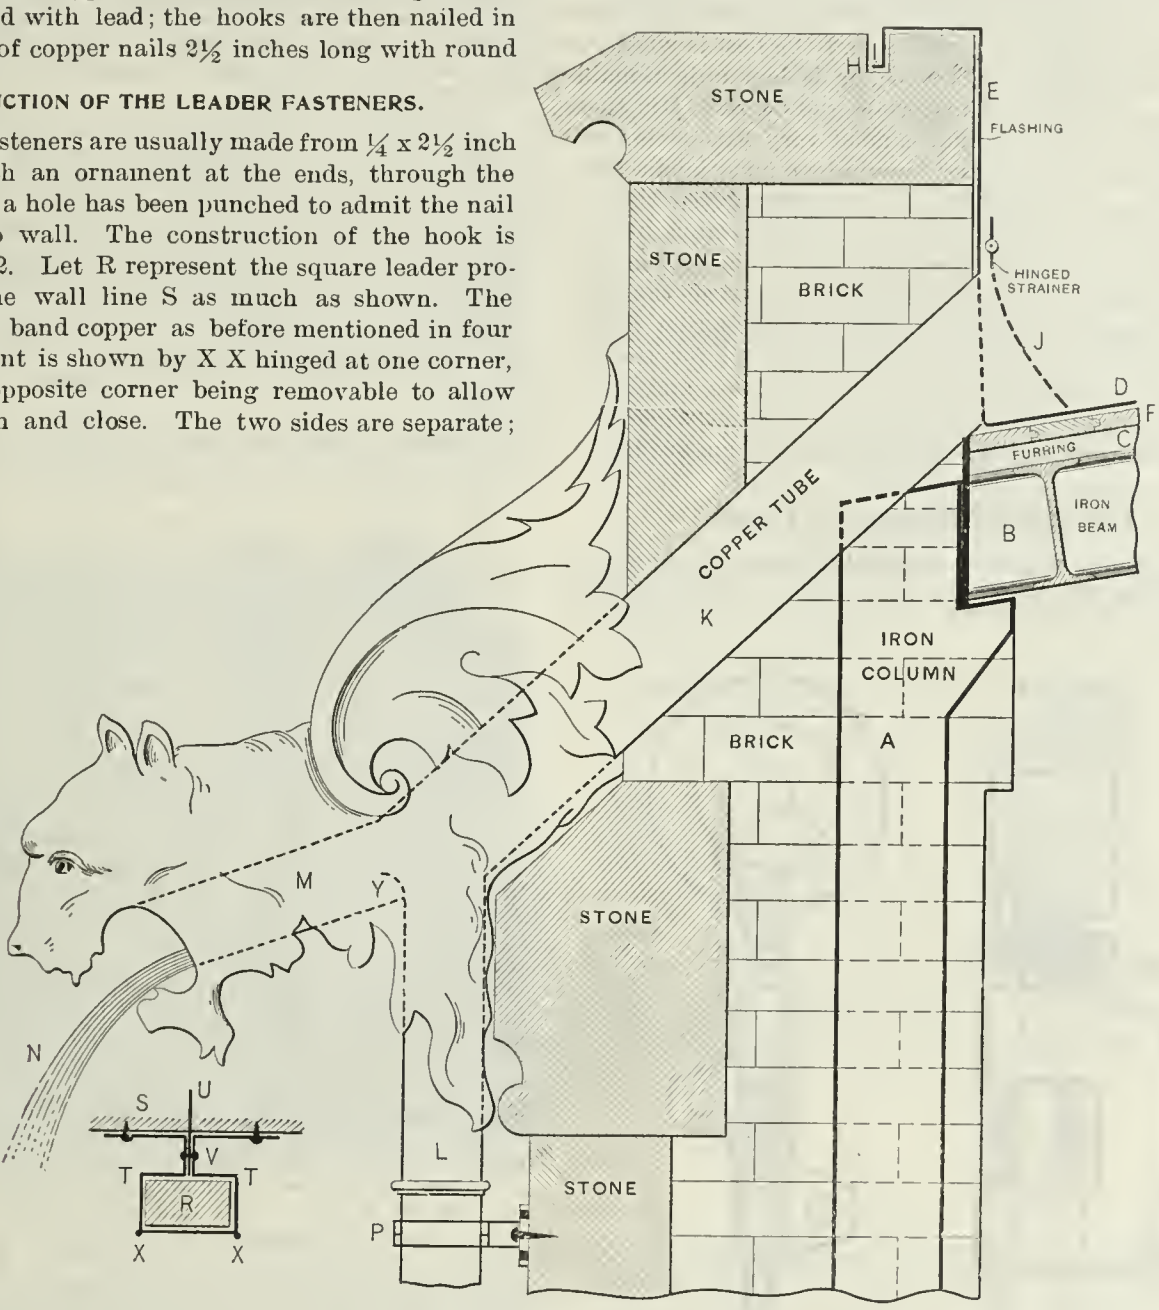

Fig. 12.—Sectional View of Parapet Wall, Showing Method of Connecting Tube to Gargoyle and Roof and Making Joint Between Flashing and Stone Work

the pin or wedge entering the wall shown at U is riveted to the two sides at V.

SOLDERING COPPER LEADER ON THE INSIDE.

When putting up copper leader on the outside of a building the seam should be clean, no solder showing. This can be done as shown in Fig. 13. A B C D represents a joint of round leader, D C being the seam at the bottom. Take small drops of solder and place inside of the leader, as shown by E E, &c., then by using a soldering copper with the handle slightly bent, as shown, the leader is easily soldered. The cross seams of the leader must be soldered outside and scraped or bronzed.

We are indebted to the Apollo Iron & Steel Company, Vandergrift, Pa., for a general plan for the town of Vandergrift. This model town, as our readers know, was laid in a bend of the Kiskiminetas River in Westmoreland County, Pa. The plan, drawn on a scale of 250 feet to the inch, shows the streets, parks and building lot divisions. Too much praise cannot be given the Apollo Iron & Steel Company for putting this work into the hands of such prominent landscape architects as Messrs. Olmstead, who laid out the land not only to good advantage from the industrial point of view, but so as to get the most beautiful effects for the town.

Painting and Repairing Roofs.

BY TWO NAIL CLEAT.

A roofer, particularly in the smaller cities, is compelled to do plumbing and sell stoves if he has any desire to amass, I was going to say wealth, but I guess I'll change it to a mass of pork and potatoes. This variety of trades is apt to keep him moving at this time of the year, but the way times have been he has had plenty, yes, a surfeit, of leisure to think and to scheme how he can make a few dollars. I guess I should have said a dollar and saved the few. This writing business is rather perplexing, for how can a man save the few when it is hard to make the solitary dollar?

To resume: He must let no chance pass, and to that end he should inform all who have roofs and gutters that there is no better time of the year than the fall to have them repaired and painted. A long winter, with its snows, sleets and freezes and thaws, is apt to try a roof and is sure to find the weak spots in one that needs attention. To repair a roof it takes a man with experience to look in the right place and it requires some skill to do the tinning on old rusty tin before the soldering is begun.

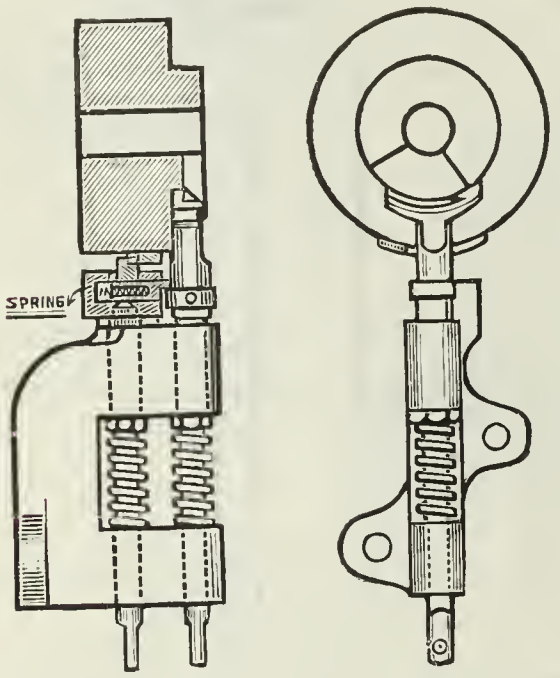
It is quite the fashion now to use acid for repair

soldering, and many men make no attempt to remove the acid after the soldering is done. The surplus acid should be wiped off with a wet sponge and a bucket of water should be handy for the purpose. I can get pay for this trouble with my old customers, to whom I have explained all about it. After the roof is attended to the gutter should be more carefully gone over, particularly if it is a box or valley gutter that might leak within the house wall. If it is a hanging gutter it should be lined up and have new straps where needed, and the spout head and leader should be looked over.

Then comes the painting, and the material used is of considerable importance. The best is none too good. Don't buy cottonseed or fish oil, but get good boiled linseed oil. Then don't take zinc white, but get good white lead; there are several qualities and the best is what you want. For coloring yellow ocher is less objectionable than some of the other materials and colors. Mix these properly, and if the weather is good very little drier will be needed, and what is used should be a good japan drier in preference to turpentine. I was first given this information by an old and highly esteemed painter, but did not profit by it; but a short time after another man of varied experience in outdoor painting gave me the same receipt, which I have tested to the satisfaction of my customers. Now is the time to paint roofs, for there is no hot sun to blister the paint before it dries, and if it is done now it will stand longer than if done when it is freezing weather or when the weather and sun are hot.

The Crosby Automatic Clutch.

The principal features of the Crosby automatic clutch for punching and drawing presses, &c., are shown in the accompanying illustrations The clutch in its original



The Crosby Automatic Clutch.

form has been in use for a long time. In order to keep pace with the times, however, the manufacturers have invented an improvement which will be appreciated by those having occasion to use it. The clutch is so arranged that, when desired, only one stroke of the mandrel or cross head can be made unless the operator removes the pressure of his foot from the treadle. In order to make a second stroke it is then necessary for the operator to apply another pressure to the treadle. The press, however, can be run continuously by changing the rod connecting the clutch haul off with the treadle to the other haul off stem, which requires but a moment to do. The clutch is made by G. A. Crosby & Co., 176 South Clinton street, Chicago.

A newly organized slate company, known as the Good Luck Slate Company, have begun operations in the Old Lehigh Tunnel quarry, Lower Slatington, Pa. This quarry has been lying idle for many years, although it is said the best slate in that section was there found. The new company are composed of F. J. Lentz, Owen Kern and Francis Remaly.

FLASHINGS.

An Englishman in reading a paper before an architectural association exhibited a photograph of a rain water leader that had been in service since it was put on the dining hall of Staples Inn, in 1655, and was reported to be in good condition to stand further service. The climate of London is said to be conducive to long service for lead leader and soil pipe.

The Bourlier Cornice & Roofing Company, Louisville, Ky., have secured the contract for the new train shed and annex for the L. & N. R. R., at Montgomery, Ala. There are over 600 squares of slate roofing, 175 squares of tin roofing and 18,000 square feet of skylights. The contract price is in the neighborhood of $20,000.

The Universal Machine Company, Canton, Ohio, are equipping some more well-known firms with their machinery for making single or double strength wire eave trough hangers. They have not yet got out illustrated circulars, but are prepared to equip firms with their machinery on short notice.

The roof of the new Spence Library of the Union Theological Seminary, at Richmond, Va., will be of fire proof construction. The trusses will be steel and the covering slate attached directly to metal supports. One end of the building is round, making a conical shape roof, and at various points of the roof slope are placed dormers and skylights. The peculiarity of the construction makes the iron work very intricate, in order to get the pleasing architectural appearance desired. The contract for furnishing and erecting the steel work for the roof has been given to the Berlin Iron Bridge Company of East Berlin, Conn.

We are advised that the report that the E. E. Souther Iron Company of St. Louis, Mo., had decided to establish a branch in Mexico is without foundation.

The cornice makers' strike in New York City and vicinity is responsible for a very decided falling off in the demand for roofing and cornice materials. Local dealers in this line complain that their city trade is suffering materially.

John Davies.

In *The Metal Worker* of last week we announced the death of John Davies of Brooklyn, N. Y., which occurred September 16. The following further particulars of his life will be read with interest: Mr. Davies was one of the oldest foundrymen in New York State, so far as length of service was concerned, he having spent nearly 60 years in that branch of trade. He was born in Clydach, Wales, August 17, 1833, where his father, George Davies, established the Bwllfa Foundry in 1828. The son took an interest in this line in his fifth year, and at the age of 12 was his father's head man, receiving full wages. He remained with his father until his seventeenth year, when he came to America and was employed by J. B. & J. M. Cornell, with whom he stayed three years. After severing his connection with this firm he spent the following eight years with John R. Pratt of New York and the North Brooklyn Iron Works, being foreman in both cases. He was then called to take charge of the foundry of Howell & Saxton, which was then starting, and his connection of 30 years with this concern as superintendent was a marked success. It was while here that he invented and introduced the manufacture of columns with green sand cores; also the hinged flask for heavy and light work, the core bar of perforated boiler plate, the truck and track and match plates, all of which improvements are now used by the largest house work foundries and serve to greatly reduce the cost of manufacture. Mr. Davies also made a number of improvements in steam engines. In 1890 he built and established with his son a house work foundry in South Brooklyn. Mr. Davies was well known in the heating trade, having for years made the castings for the Scollay boiler. During his business career he collected around him many friends in every branch of foundry work, to whom his death will prove a great loss.

The coroner's jury at Hazleton, Pa., which investigated the death on September 10 of the striking miners by the hands of the sheriff's deputies at Lattimer, rendered on Monday a verdict blaming the sheriff and stating that "the killing was unnecessary and could have been avoided without serious injury to either person or property," and finding that "the killing was wanton and unjustifiable."

The *Australasian Trade Review* reports that a Commercial Museum, on the lines of the museum at Philadelphia, is to be established at Melbourne. The object is to collect samples and information relating to local and foreign manufactures, and to make such available for commercial purposes.

HEATING AND PLUMBING.

The Sunray Boiler.

In the accompanying illustration we show the sections of the Sunray boiler, which is being put on the market by the J. L. Mott Iron Works, Beekman and Cliff streets, New York City. It is pointed out that there is ample space in the combustion chamber to promote combustion, and the flues are so arranged as to secure an indirect draft and a large fire surface. The construction is such that the headers are included in the boiler, which is of the slip nipple type. The inner surface of the fire box and combustion chamber is corrugated, increasing the surface presented, and the water sections form the bottom of the ash pit. The circulation of water in the boiler is controlled by means of a patented diaphragm placed in the steam dome of each section to produce a quick separation of the steam from the water and to prevent all danger of priming, ample steam space being provided in each section to preserve a steady water line under all conditions. It will be noted that only two nipples are required in each section, one at the top and one at the bottom, and that the bolts used for holding the sections together are all outside of the water passages, so that they are not subjected to the changes of temperature with the attendant expansion

The Sunray Boiler.

that would follow their immersion in the water passages. This latter provision reduces the possibility of leaks. The grate furnished is the lock shaking pattern, and so constructed that any grate bar may be taken out without disturbing the others. The boilers are made with two widths of grates, the first six sizes having a grate 20 inches wide and increasing 5 inches in length with each section, while the eight larger sizes have a grate 30 inches wide increasing 8 inches in length with each section, the grate in the smaller heater being 20 x 21 inches and increasing to 20 x 46 inches. In the larger size the smallest grate is 30 x 30 inches and increases to 30 x 78 inches. The smallest heater presents 48 square feet of heating surface, and increases 12 square feet in capacity with the addition of each section. The larger heater has 120 square feet of surface, increasing 30 feet with the addition of each section. These heaters are rated to carry from 275 to 2250 square feet of steam radiating surface and from 450 to 3800 square feet of direct hot water heating surface. The smaller series are tapped for 3 inch and the larger sizes have 4-inch flow and return mains. The hight of the water line in the smaller sizes is 42 inches and in the larger sizes 54 inches, the completed heaters standing respectively 54 and 66 inches high. The smallest heater of the small size weighs 1200 pounds and increases 230 pounds with the addition of each section, while the smallest heater of the large size weighs 3000 pounds and increases 600 pounds in weight with the addition of each section.

A New Radiator Catalogue.

A handsome example of the printer's art comes to us in the form of a catalogue from the Standard Radiator Company, who have offices in Buffalo, St. Louis, New York, Chicago and Boston. The catalogue consists of 42 pages of fine paper printed in two colors, and bound in embossed red paper covers bearing a design in gilt and the name of the company in embossed black letters. The last page has a monogram of the company. On opening the catalogue the various addresses of the company and the date 1897 appear. While an introductory note states that the catalogue contains useful information in reference to their manufacturing plants at Buffalo and St. Louis, a note states that radiation specified as "Buffalo Standard" is made at the Buffalo works only, and that radiation specified as "St. Louis Standard" is made at the St. Louis plant only, while "Standard" radiation is made at both. The first illustration is of the Buffalo Standard single column ornamental radiator for steam and hot water. The next pages show the Buffalo Standard single and three and four column plain surface radiators, followed by the Standard plain and ornamental radiator. The various styles of Buffalo Standard radiators are also shown ornamented. The company also point out that their radiators are made in all their various styles for both steam and hot water, the steam radiators having connection only at the bottom, while the hot water radiators are naturally connected both at the top and the bottom. An equally attractive variety is included in the line of St. Louis Standard radiators. The Empire is a new radiator, having solid end sections and of the two-column type. The pamphlet includes low radiators for windows, curve radiators for bow windows, circular radiators for columns and corner radiators for setting in the angle of a room. Some of the styles are also shown as direct-indirect radiators, and special cuts show the various tappings with which these radiators can be furnished. One page is devoted to a cut showing a radiator with special high legs and bearing the statement that they can be furnished in 6, 6½, 7, 8, 9 and 10 inch hights. Another page is devoted to the Standard indirect radiators, which can be furnished with various styles of tappings so as to reduce the labor of the steam fitter. The last illustration shows the Standard Quartette, including two styles of two-column radiators and a three and four column radiator. The last few pages are devoted to a telegraphic code. The catalogue presents the newest goods made by the company, and they are desirous of sending a copy to all who are engaged in the heating trade.

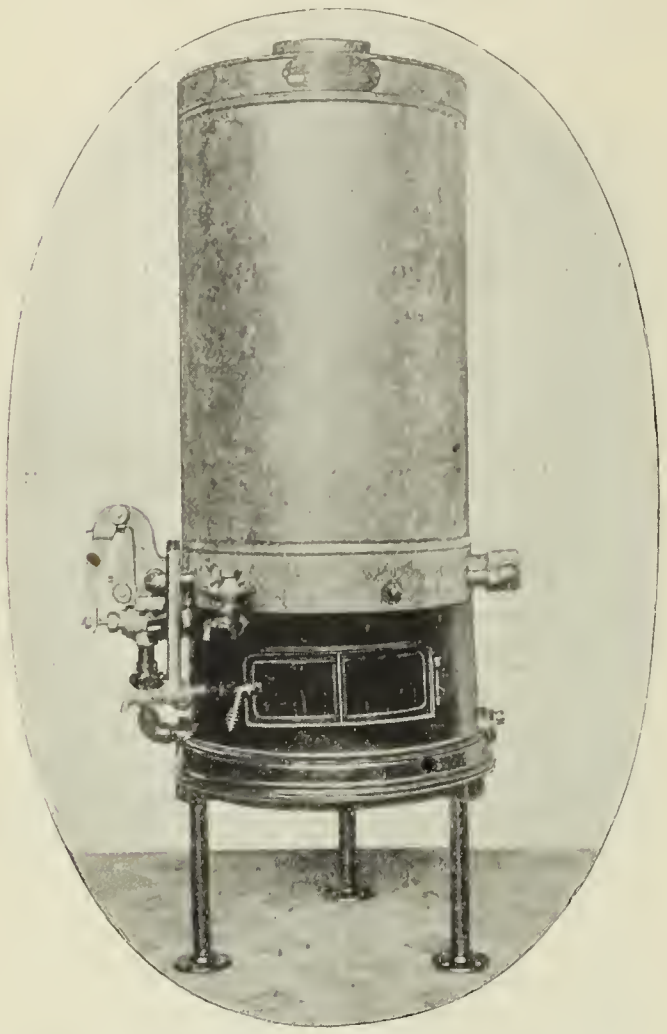
The Gem Boilers.

"High Grade Heaters for Modern Houses" is the title of a 36 page catalogue printed in two colors and bound in a linen covered board cover, issued by Johnson & Co., 84 John street, New York City. The first pages are devoted to the Little Gem, a heater which the contractor will find adapted to all kinds of small work and made in three different sizes. This is followed by the Gem heater, which has a larger capacity, and the Royal Gem, a heater of still larger capacity, all being made for both steam and hot water work. These heaters are all of the round form and horizontal sectional type, and some are arranged to secure an indirect draft. The Crown Gem heater, of the vertical sectional type of modern construction, is designed for large work. This is followed by the Economist, a sectional hot water heater designed for brick setting. The Economist steam heater is also designed for brick setting and is of the circular form of construction. The catalogue contains a price-list of a number of specialties used by the heating contractor, and in additional to testimonial letters and references has much to attract the buyer of such goods.

The Bridgeport Steam Heating Company, Bridgeport, Conn., have recently completed the Heating Apparatus in the factory of the American Graphophone Company, and have set a Gurney Hot Water Heater in the residence of P. J. Dewitts. They are installing Hot Water Heating Plants in the greenhouse of David Beach, and are using two Doric Steam Heaters in a system for C. Y. Beach, New Haven. They are also busy in their Plumbers' and Steam Fitters' Supply business.

The Ruud Instantaneous Automatic Water Heaters.

A problem which has been brought to the attention of the plumber within the past two or three years has been the supplying of hot water in residences and particularly apartment houses At first the demand was for supplying



The Ruud Instantaneous Automatic Water Heater.—Fig. 1.—*General View of Heater*

hot water during the summer season, but with the modern furnishings in buildings it is necessary to supply hot water in apartment houses throughout the year, as it has become customary to furnish heat for the entire building, including the kitchens in the various apartments, and in many instances the cooking in these kitchens is done entirely by gas.

In the accompanying illustrations we show the Ruud instantaneous automatic water heater and the thermostat used in connection with it, manufactured by the Ruud Mfg. Company, Pittsburgh, Pa. Fig. 1 is the water heater, which is designed to be placed in a basement and supply hot water for one family in a residence or several families in an apartment house. The heater is constructed so that it may be connected direct with the main house water supply. It contains several feet of copper tubing arranged in the form of a coil through which the water must pass before it is discharged hot to the different fixtures in the building. Underneath this copper heating coil is a gas burner which is kept burning until the water in the heating coil has reached a given temperature, when the thermostat shuts off the gas supply and there remains stored in the heater the amount of hot water which the coil contains.

A sectional view of the thermostat is shown in Fig. 2, a feature of which is that the hot water never comes in contact with any of the valve operating mechanism, so that it is not likely to corrode, and is said to last and operate satisfactorily for an indefinite period. By a study of the cut it will be noticed that a steel rod is inclosed in a water chamber formed by an inner and outer brass tube, and is connected with the rigid parts on the tube by means of hinged links which can be adjusted in their actions by adjusting screws. Connection with the water chamber in the brass tubes is made with the water in the heater coil, so that when the temperature falls below a desired point the contraction opens the gas supply to the main burners, which are set in operation by means of a pilot light which is connected with the gas supply independent of the burner and valves. By this arrangement hot water is at the service of the occupants of a building at any hour of the day, the thermostat operating automatically and independently at all times. The heaters are made to supply 1½, 2½, 4 and 8 gallons per minute at a temperature approximating 150 degrees, and the burners can be supplied for use with natural or artificial gas, and are said to be economical in their consumption. The company have prepared a catalogue showing their water heater used in connection with a circulating system in a building, and also in connection with a large hot water storage tank. These catalogues can be secured on application.

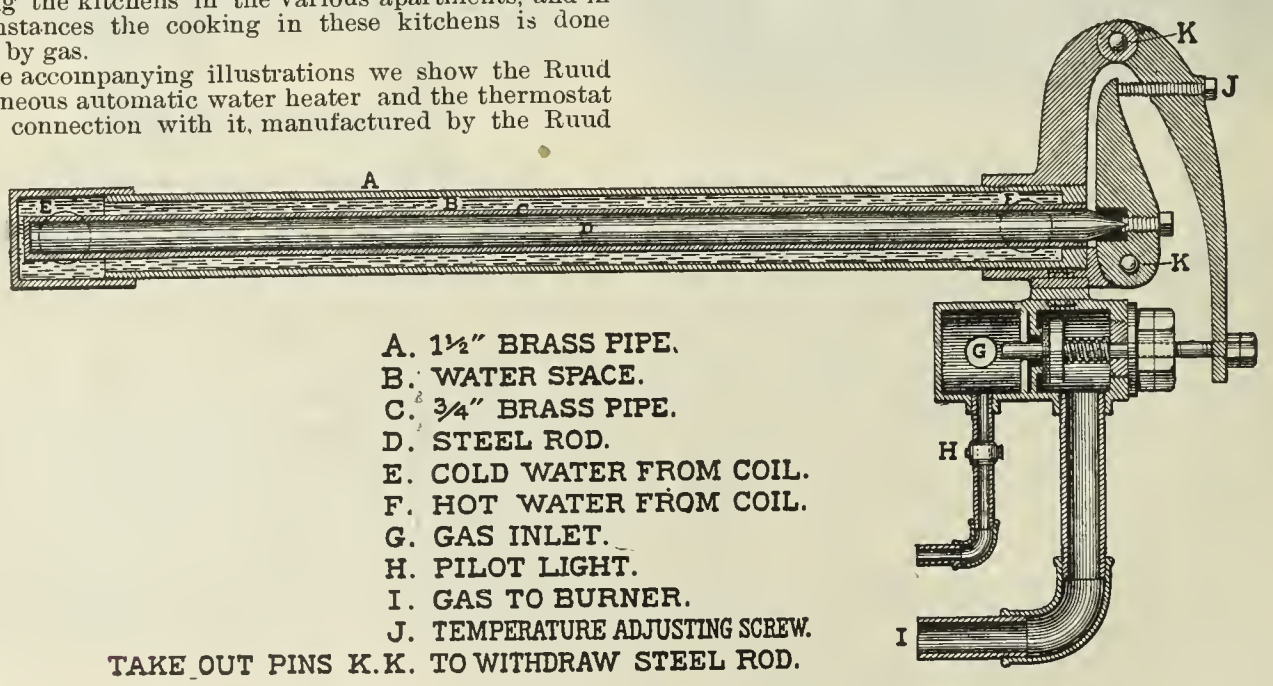


Fig. 2.—*Sectional View of Thermostat.*

Water Service Regulations of Fort Worth, Tex.

The following extracts are taken from the ordinance regulating the Forth Worth, Texas, Water Works, which contain information that may be of interest to those engaged in the plumbing business :

TAPPING OF MAINS.

Section 9. No plumber or other person, except the tapper employed by the Fort Worth City Water Works, or the city plumber, will be allowed to tap any street main. For domestic service in families of not over eight persons, ½-inch pipe ; for over eight persons and not exceeding 15 persons, ¾-inch pipe. Taps for larger pipes than the above by special agreement only.

STYLE OF WATER CLOSET.

Sec. 10. No permit will be granted for any style or make of water closet, except what is known as a tank closet, with self closing valve, or automatic flow from a tank. No stop or compression cock or continuous flow allowed for flushing water closets or urinals except through meters. In case of breakage of the bowl or hopper of any style of closet except the tank closet, the same shall be replaced with a tank closet, or privilege for city water for the same will not be allowed, and overpaid rent returned.

HOT WATER BOILERS.

Sec. 11. All boilers for heating water shall be provided with air valves to prevent collapsing when the water is

drawn off. Advise opening all hot water faucets to allow steam to escape, when the water is cut off.

PLUMBING FIXTURES.

Sec. 12. No joints on lead pipes but wipe or ball joints. No goose necks will be allowed on sidewalks. Sinks, wash stands, urinals or any other apparatus connected with the service where a continuous stream may flow must have self closing compression cocks. Special permits will be given for hose bibs. No hose bibs allowed unless parties pay for hose privileges.

PLUMBERS' RETURNS.

Sec. 13. Plumbers shall make full and complete returns of the use for which water is applied under any permit granted. Said returns must be made by the plumber doing the work within two days after the completion of said work, as the water will not be turned on any premises until after returns are made and the work reported to be in accordance with the rules and regulations herein described.

TURNING ON WATER.

Sec. 14. No plumber shall turn on or off water from the street stop cocks or allow any person in his employ to do so without a written permission from the Fort Worth City Water Works, except for repairs.

FOR VIOLATION OF RULES.

Sec. 15. Any plumber violating any of the rules and regulations governing the introduction, supply and consumption of water, or who shall voluntarily, or at the request of any consumer, introduce any hydrant, pipe, bath, water closet, urinal or any other device or fixture which is prohibited or which has not been permitted by the Fort Worth City Water Works, shall forfeit and pay to the city the sum of $100, which may be recovered on his bond, or by direct action, and in addition his license shall be forfeited and not be renewed nor he be allowed to do business either for himself or other plumbers, in connection with the water works, until after the expiration of 30 days, and until the payment of such fines.

STOP BOXES.

Sec. 16. Consumers shall cause to be placed at their own expense in his, her or their attachments in the sidewalk, and not exceeding 1 foot from the sidewalk curbstone, a stop cock and stop box, that shall be under the exclusive access and control of the city, and on any violation of the agreement on the part of the consumer the city will at once remove such service from the city pipes and refuse to again make such connection until the consumer shall pay all expense of removal and replacing, and give satisfactory security against violation. The street stop shall be what is known as "ground key work," with a T handle and nut and washer bottom, and the stop box shall be the iron screw extension box, with screw bolts to secure the top and to be unscrewed or opened with a socket wrench, and not defaced or opened in any other manner. The tops of said boxes must be kept closed and in repair by the consumer.

SEWER RATES AND PRESSURE REQUIRED.

Sec. 24. That all persons having upon their premises a water closet or privy with sewer connections shall pay the lawful rate for water closets, whether such closet or privy have attachments connected with the city pipes or not. That any person violating this ordinance shall be deemed guilty of a misdemeanor, and shall be fined before the judge of the city court not less than $5 nor more than $10 for each offense. This ordinance not to conflict with persons having an artesian well flowing into a tank, giving satisfactory pressure for flushing. Persons or corporations having artesian wells or any device for flowing water into a tank affording a pressure not less than 10 pounds to the square inch for flushing their closets, shall pay one-half the schedule water rates for water closets, or rates known as "Sewer Rates." That persons refusing to pay the said "Sewer Rates" shall be deemed guilty of a misdemeanor, and shall be fined before the city judge of the city court in a sum not less than $10 nor more than $50 for each offense.

[Note.—This ordinance is to protect the city against loss in the maintenance and flushing of sewers, which is not included in the ad valorem city tax to pay off the bonds for construction of sewers.]

OPTION TO SET METER.

Sec. 25. The City Water Works Department are authorized and empowered, when in their judgment the welfare of the city may demand, to have water which may be supplied to any consumer, whether corporation, firm or individual, and for whatever purposes supplied, measured by meter, and to have such meter so located in the building or vicinity as the water works superintendent may designate, and water shall not be furnished parties who fail to comply.

OWNERSHIP OF METERS.

Sec. 28. The city reserves the right to own and control all meters of 2 inches and under, it being necessary so they can be protected, kept in repair or exchanged during repairs. No meter over 2 inches in size will be furnished by the city unless by special agreement or contract. Consumers will be allowed to own meters over 2 inches in diameter, provided the same is under control of the city. Parties wishing meters shall enter into a contract to keep the meter until the expiration of the fiscal year.

CONNECTIONS OR TAPS.

Sec. 34. The owner of a group of houses fronting on any street where there is a water main shall be required to provide a separate pipe and distinct connection with the main for each of said houses, and shall also be required to have a good and substantial fence, without gate, steps or other communication, inclosing separately each house and yard, to prevent persons from one yard from obtaining water from the hydrant of another yard. Owners of store and office buildings will be required to pay for water for the entire building, unless there is a separate cut off for each floor, located at the sidewalk, and no permit issued for less than two cut offs for more than one-story business buildings.

All single residences or houses shall be required to have separate and distinct connections to the city mains, and separate stop cock, and whenever the Water Works Department shall find more than one single house supplied from one pipe (without special permission), they shall at once have the water turned off, and the same shall not be again turned on until separate connections are made, and under no circumstances shall there be more than one service connection made to any one house or premises without the knowledge and consent of the Water Works superintendent.

PLUMBERS' LICENSE—PLUMBERS' BOND.

Sec. 35. Any person intending to follow the business or occupation of plumber, in relation to or in any way connected with the City Water Works, its mains, pipes, fixtures, &c., shall, before undertaking any work in connection therewith, first apply to the Water Works Committee in writing for a license, which license shall not be granted by said committee unless the applicant submits to said committee the certificate of two plumbers in good standing, to be selected by the Water Works superintendent, or other evidence satisfactory to the superintendent that the applicant is thoroughly competent to do plumbing work.

If the said committee elects to grant said license, with the approval of the City Council, it shall first require said applicant to enter into bond in the penal sum of $1500, with good and solvent sureties, conditioned to save the city harmless from all danger of whatever kind resulting from negligence or unskillful work on the part of said plumber, and abide by the rules and regulations made by the city touching plumbers' work. The above bond will be renewed every year, and failure to renew the said bond as above required or demanded shall of itself operate as a revocation of said license.

ANNUAL WATER RATES.

Bath, private residence	$6.00
Bath, private residence, each additional tub	3.00
Bath, private residence, summer rate, 6 months	4.00
Bath, boarding house	8.00
Bath, boarding house, each additional tub	4.00
Bath, boarding house, summer rate, 6 months	5.00
Baths, public, each	14.00
Baths, above 4 tubs, meter, or each	10.00
Urinal, private, self closing	6.00
Public, self closing	10.00
With stop cock, 1-16 inch opening	15.00
Constant flow, 1-16 inch opening	30.00
Constant flow, larger opening	meter.
Water closet, private, one closet	5.00
Private, each additional	3.00
Private boarding or lodging house, 1	6.00
Each additional	3.00
Public, one closet	8.00
Automatic flushing	meter
Wash basin, plain cock	12.00
Self closing	8.00

SEWER RATES.

Water closets, public, each	$4.00
Private	2.50

CEMETERIES.

Water consumers using water for grave lots, in any of the cemeteries, will be charged as follows:

One cent per square foot per year, with minimum rate of $1 per year, payable yearly in advance.

METER RATES, PER 1,000 GALLONS.

Determined by the monthly consumption, Sundays included.

Gallons per day.		Gallons per day.	
100 to 200	$0.40	1,401 to 1,600	$0.26
201 to 400	.38	1,601 to 1,800	.24
401 to 600	.36	1,801 to 2,000	.22
601 to 800	.34	2,001 to 3,000	.20
801 to 1,000	.32	3,001 to 5,000	.18
1,001 to 1,200	.30	Over 5,000	Special.
1,201 to 1,400	.28		

A minimum rate of $10 per annum will be charged on all metered services where the consumption is less than

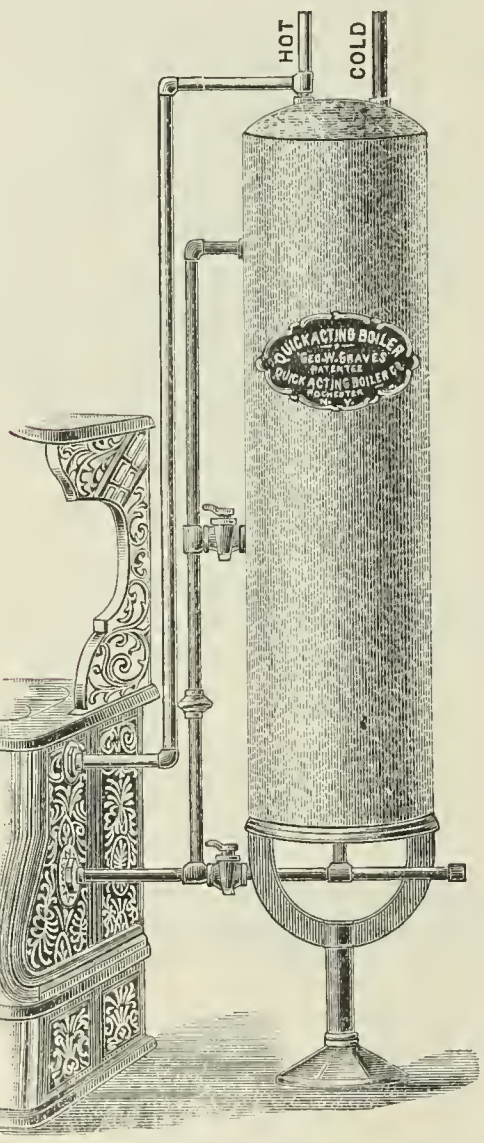
12,000 gallons during the fiscal year, to be paid quarterly in advance, with no charge for rent of meter.

The above charge allows the consumer from 1 to 1000 gallons of water per month ; more than 1000 gallons per month to be paid monthly at the above schedule of meter rates.

A yearly rental of $6 shall be charged for the use of each meter, payable monthly, except in cases where the consumers pay the minimum rate.

The Quick Acting Boiler.

The use of gas for heating water for domestic purposes has brought out various devices for use in connection with the ordinary kitchen boiler. In the accompanying illustrations we show the boiler brought out by the Quick Acting Boiler Company of Rochester, N. Y., and manufactured by the John Trageser Steam Copper Works, 447-457 West Twenty-sixth street, New York City. When gas is used in connection with the regular kitchen boiler it is found that circulation through the entire body of water in the boiler delays securing a supply of hot water. The boiler shown in Fig. 1 is designed for use in connection with either a coal or gas range, and in order to secure hot water quickly connections are made at three different points in the boiler to carry the colder water to the water back, and it may be readily seen from the cut that when the stop cock on the pipe at the bottom of the boiler and the side connection are closed only a small quantity



The Quick Heating Boiler.—Fig. 1.—Boiler Connected with Cooking Range.

of water in the upper part of the boiler is in circulation. When more time can be spared and a larger quantity of water is needed, by opening the stop cock in the middle connection a larger quantity of water is put in circulation and heated. When it is desired to heat the entire quantity of water in the boiler, by opening the bottom stop cock all the water in the boiler will be circulated through the water heating device.

In Fig. 2 the boiler is shown in connection with an independent gas water heater, the same provisions being made for circulating all or different portions of the water in the boiler through the heater. When the two stop cocks are closed it is claimed that with the average heating device 10 gallons of water can be heated to a temperature of about 150 degrees in about 20 minutes, which will give from 25 to 30 gallons of water at the temperature required for bathing, and it is pointed out that this fact alone shows the advantage of this type of boiler when used with modern apparatus. In many instances a large boiler used in connection with a coal range giving satisfaction is connected with a gas range having a water heater of less capacity, and which is used only at short periods during the day, and under such firing a large

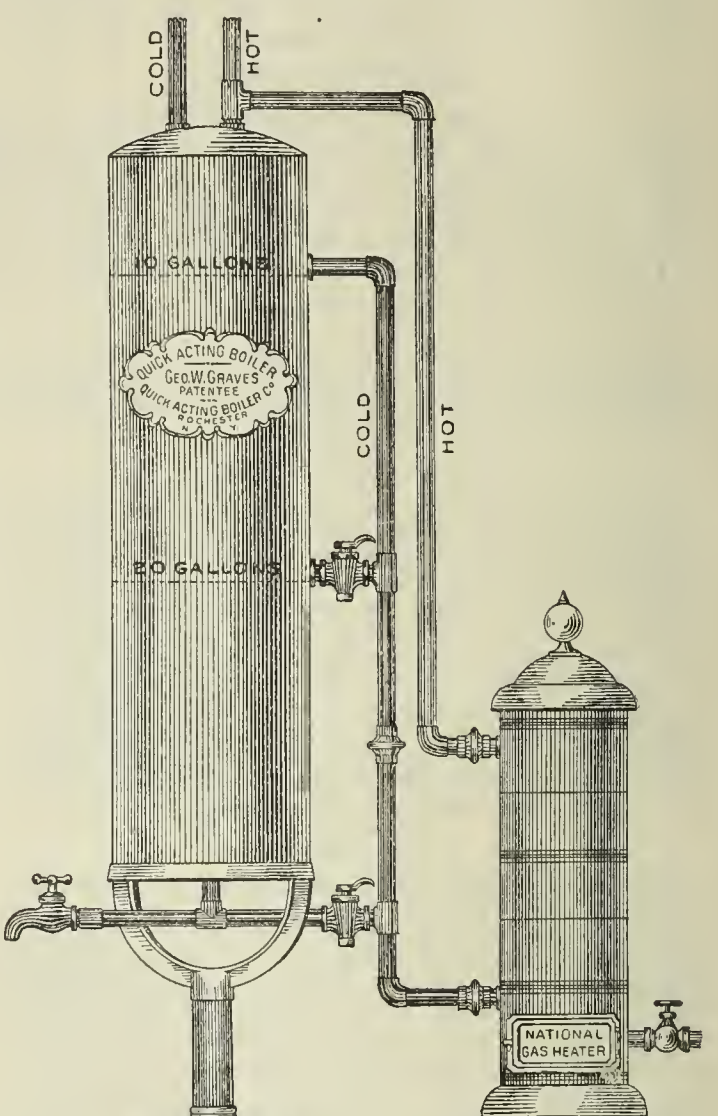


Fig. 2.—Boiler Connected with Independent Gas Heater.

boiler fails to furnish the necessary domestic supply of hot water. It is pointed out that with a boiler of the type shown satisfactory operation is secured when connected with a coal range and also when connected with a gas range. Circulars illustrating and describing the boilers and giving information as to the economy with which the work can be done, and the prices, can be secured on application.

Making Soil Pipe Joints.

BY A WORKMAN.

I have noticed that my employer takes more pleasure in showing to his customers as they come to new buildings in which he is doing the work his completed work than he does the roughing-in work, and yet those who are engaged in the plumbing business know thoroughly well that care in doing the roughing-in work is of more importance than the handsome finish in the bathroom of a luxurious mansion. To some it is a simple matter to make the joints in cast iron soil pipe. They think that it is only necessary to put in some oakum in order to prevent the molten lead from running down the pipe, and then, if the lead wells up slightly above the top of the hub and is flattened down, that all is done that is required.

In one case where I worked on a job of running the soil pipe in a building seven stories high there were several stacks of soil pipes. I ran two of the stacks, and the men who worked on several of the other stacks were from one and a half to two floors ahead of me with their work, which was noticed by my employer, who remonstrated with me for being so slow, saying that he paid me the same wages as he did the others and expected to get as

much work done in a day for his money. I told him that if he carefully kept a record of the time required in making the joints and repairing leaks I thought he would make more money on me than he did on some of the others, and with this answer he seemed satisfied to wait for the final result. I had but one leak in my work, which was overcome by a little extra calking. There were several leaks in all of the other stacks of soil pipe, and the result was that I was employed three days in repairing these defects. On this account I thought that some in the trade might be interested in my method of making a joint.

I am careful to pick over my oakum, and to have a good yarning tool. In putting in the oakum I am careful to have the spigot end of the pipe centrally located in the hub. I pour all of my joints, whether horizontal or upright, with a gasket, so that on removing the gasket the lead has an upward pitch from the hub to the pipe, as shown in Fig. 1. After the lead is poured, I take a cold chisel and go all around the pipe, and drive the lead from the pipe until it assumes the shape shown in Fig. 2. Then with a tool that is wide enough so that it will not wedge down between the hub and the pipe so as to split it, I flatten all expanded lead so that when it is finished it is as shown in Fig. 3.

A mechanic will readily see that by flattening the lead down it must be forced tightly against the pipe and against the inner side of the hub, making not only a tight joint against sewer gas and water, but also one that is less likely to be affected and destroyed by expansion and contraction than a joint that is made by a simple riveting process, as is the case when the lead is allowed to well up a trifle above the hub and then driven down into it without anything to induce a sidewise expanson.

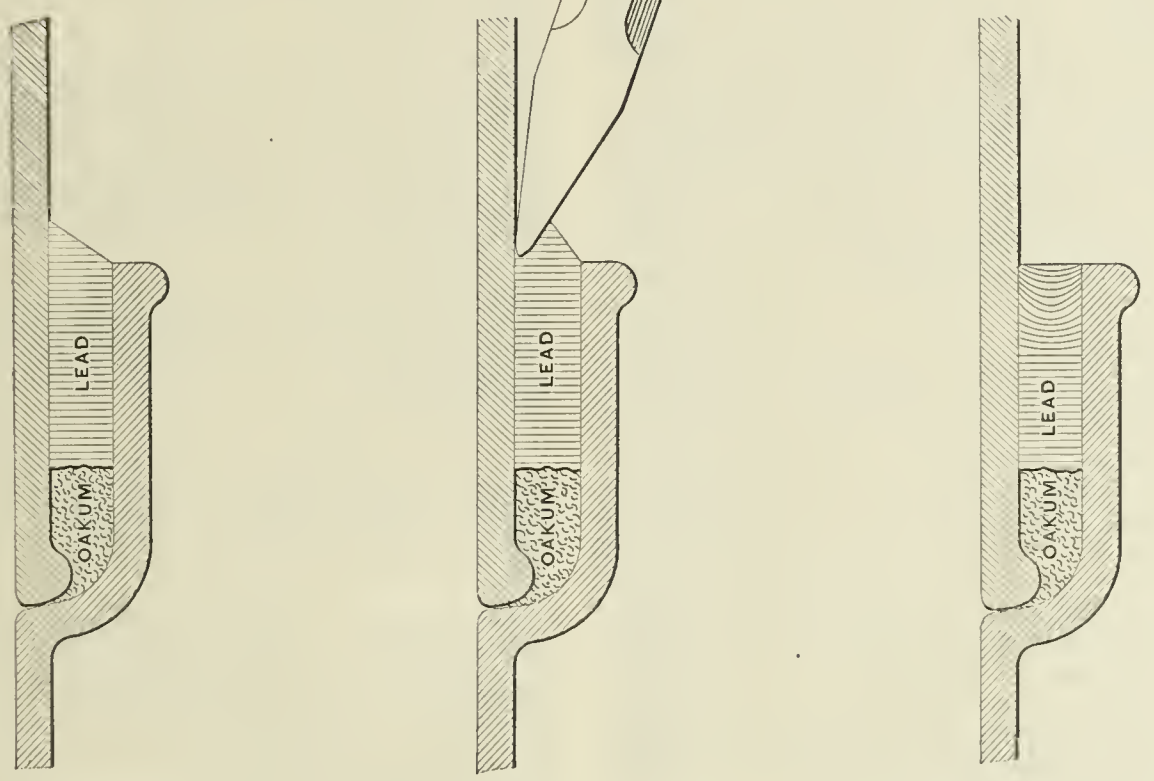

Fig. 1.—Joint Poured with a Gasket. *Fig. 2.—Setting the Lead Away from the Pipe.* *Fig. 3.—Showing the Lead Expanded to Make a Tight Joint.*

MAKING SOIL PIPE JOINTS.

Ideal Direct Draft Boiler.

The American Radiator Company, Lake and Dearborn streets, Chicago, are bringing out the Ideal direct draft boiler for steam heating. It is especially recommended by the company for use in localities having a poor quality of soft coal. The flue surfaces are easily accessible for cleaning. This boiler is of the vertical portable type, and in it are retained the features which have made the Ideal line of boilers distinctive. In the fire pot and first section above it are the largest water spaces. The dome provides for ample steam capacity, and the circulating column at the back of the boiler insures a steady water line. This circulating column is a distinguishing feature of Ideal boilers. The sections are connected with cast iron push nipples. Economy in fuel consumption is one of the claims made. It is furnished in 14 sizes, ranging from 225 square feet of direct radiation to 1500 square feet.

President Faure Booming Bathtubs in France.

President Felix Faure of the French Republic is a great advocate of cleanliness and sanitation. From all accounts he is doing more to spread the use of the bathtub in France than any other Frenchman of these or former days. A Paris correspondent of the New York *Sun* says "that wherever the President goes for a week or ten days there must be a bath house with all modern improvements. He refuses to stop even over night in a house or hotel that has no bathroom. His hobby causes many persons inconvenience, for the bathroom is not a universal institution in France as in this country. In fact, the provincial French towns are as barren of private bathtubs as most prairie villages in this country. Nevertheless the President holds fast to the bathtub as a condition precedent to his visit to any town or castle. In the Presidential palace in Paris and in the castle at Foutainebleau, M. Faure has had elaborate bathrooms fitted with the latest appliances and luxuries. In the castle at Rambouillet last year the President caused $20,000 to be spent for bathrooms which he might use during his three or four weeks' residence there.

"The President's passion for cleanliness has been a source of much vexation and industry at all the proviucial prefectures which he has visted since succeeding M. Carnot. Usually on his excursions through the land he lodges at these prefectures, and, as none of them was provided with bathrooms when he began his tours, there has been a great bustling about to make good the deficiencies. A large bath house was built last year at the prefecture in Rennes, preparatory to his brief sojourn there, and a similar house was erected at the prefecture in Valence this year in anticipation of his visit. The vigor with which the President is leading his movement for bath reform is said to have brought him many converts and to have given the neglected bathtub industry a great boom in the republic."

James J. Lawler of the Lawler Water Feed & Damper Regulator Company, New York City, spent a portion of last week in Philadelphia attaching three of his Regulators to a large Heating Plant installed by Robert Scott & Co., at Glenside, Pa., in which three large sized Mercer Boilers were used.

Streets Not Periodically Torn Up in Germany.

In writing from Germany a correspondent of a Chicago paper compares the practices and customs there with those of the United States, and the following extracts will be of more or less interest to the plumber :

"In Germany everything is done in a thorough, permanent way. We build for years. They build for centuries, and in the transition of the romantic old capitals of petty princes and grandiose dukes into smoky and bustling industrial centers the Germans have brought habits of thoroughness, patience and stability that have characterized all their progress in the arts of civilized life. They have shown more of the scentific spirit and method than any other people. The old streets have been extended and widened through the little farms of the poor or the suburban seats of the magnates and paved with asphalt or Belgium blocks, and schools and public libraries, art galleries, museums and other means of education, which the Germans consider essential to civilization, have followed the extended streets as regularly and as rapidly as water and gas supplies.

"The municipal authorities regulate building in the severest fashion. The new streets require the best kind of paving, and it is not put down to be torn up again in a few months to lay a forgotten gas or sewer pipe, but before the contract is let for paving the officials make sure that they have taken care of everything that needs to go underground for generations. In Chicago, in Washington and other American cities a street is paved upon petition or when the money is appropriated. The next year a new gas pipe must be laid along that way, the pavement is torn up for a mile or two, and it is generally eight or ten months or a year perhaps before the Commissioner of Public Works succeeds in persuading the gas company to replace it. The next spring the Water Commissioners decide that a larger pipe should be laid in that street and the pavement is torn up again. The year following another gas company is formed, and the pavement is torn up in order to enable it to furnish competition with the old one. The next year the first gas company discovers that its facilities are not adequate, and rips up the pavement again. Every reader will recognize his own experience and realize that within a period of ten years an amount equal to the original cost of the pavement is wasted in repairs and in replacing it for the purposes named, without considering the inconvenience and annoyances suffered by the people who live in the street.

"In Germany they do things differently. Before a pavement is laid the experts—and they are experts with university degrees framed and hanging in their offices, not ward politicians—who have charge of underground engineering put their heads together and consider what pipes and connections are likely to be needed along that particular street during the next three or four centuries. Then when these are supplied the pavement is laid, and it is not laid upon a thin crust of broken stone, but upon a foundation that will last forever. I saw some workmen trying to cut away a section of pavement in Berlin to make room for the foundation of a new monument. With crowbars, pickaxes, chisels and drills they had gone down about 12 or 14 inches into the pavement and were just able to jam a crowbar into the stuff so that it would support itself. This pavement cost money when it was originally laid, but was put down to stay, and $100,000 expended in that manner at the start will last longer than $1,000,000 worth of the pavements that are laid in American cities."

A three-sided lead pencil is received from the Nason Mfg. Company, 71 Beekman street, New York City, the different sides being red, white and blue, and bearing the inscription that they can furnish Pipe, Fittings, Valves and Steam Engineering Specialties. It is supposed that the heating contractor who is possessed of one of these pencils can invariably figure a profit where the Gulf Stream and Equator Heaters and the Nason Specialties are included in the estimate.

The Detroit Brass Works, Detroit, Mich., will erect a new two-story brick factory 85 x 100 feet in size.

Plumber for the Government.

The United States Civil Service Commission announces that it is desired to establish an eligible register for the position of journeyman plumber. From the register thus established a selection will be made, from eligibles residing in the vicinity, to fill a vacancy in the position of journeyman plumber in the United States Court House and Appraiser's Stores Building, at San Francisco, Cal., at a salary of $5 per day, Sundays excepted.

Persons desiring to compete for this position should apply to the secretary of the Board of Examiners at the post office at San Francisco, Cal., for application blank forms 304 and 394, which should be properly executed and promptly forwarded to the United States Civil Service Commission, at Washington, D. C. No applications will be accepted after the hour of closing business on November 6, 1897.

NOTES.

The examination of master and journeymen gas fitters in Boston began on October 1, when the new law relative to the licensing of gas fitters and to the supervision of gas fitting in Boston went into effect. The examining board consists of Dr. Samuel H. Durgin, chairman of the Board of Health, Building Commissioner John H. Damrell and Charles B. Gould.

The City Council of Pawtucket, R. I., has authorized Inspector of Plumbing J. Sewall Reed to purchase a smoke testing machine for the purpose of testing plumbing in new buildings after the fixtures are set.

The Royal Steam Heater Company of West Gardner, Mass., have secured the contract for heating the new high school building, in which it is stated over 7000 feet of piping will be required.

John A. Holland of Norwich, Conn., has secured the contract for heating the new Post Office and Custom House Building at New London, Conn., and will use a Wrought Iron Tubular Boiler and the Direct and Indirect Radiation manufactured by the H. B. Smith Company of Westfield, Mass.

A letter from O. L. Jayne informs us that the Fletcher-Steen Hardware Company, Boise, Idaho, have been awarded the contract for installing a Hot Water Apparatus in the Odd Fellows' Building in that city, and will use 2460 square feet of Direct Rococo Radiation. The hot water will be supplied from the hot artesian wells.

Under the firm name of Menzies & Menzies, John and Charles Menzies, formerly connected with the Robert Morgan Plumbing Company, have opened up a Plumbing establishment at 6 Pitkin street, New Haven, Conn. In a circular they make the announcement that their efforts in the trade will be principally devoted to Sanitary Plumbing, Gas and Steam Fitting.

The Automatic Water Tank Company have been incorporated at Mankato, Kan., by W. S. Field, G. F. Smith, D. H. Stafford and N. E. Stafford.

Shainline & Moires have opened a Plumbing establishment at the corner of Fifth and Green streets, Bridgeport, Pa.

An error was made in *The Metal Worker* last week in referring to the Italian Flue Radiator for hospitals by stating that it was next door to where it is. We have no doubt that any who called at the wrong place to see it were directed to the American Radiator Company, at 92 Centre street, New York, for the New York representatives of the American Boiler Company are very courteous.

An English plumber who was inclined to nurse his job until another hove in sight, to the disgust of the house owner, was greeted on entering the bathroom one morning with a ribbon bearing the following inscription in old English:

"Gette dun, annde fromme thys roome gette oute,
Hyf youre notte dun toe daye ye bosse will shoute."

Bids for heating and plumbing the girls' dormitory of the West Virginia Colored Institution, at Piney Grove, near Charleston, W. Va., will be received by the Committee on Heating until October 9.

H. S. Higgins, formerly assistant treasurer of Richmond Stove Company, Norwich, Conn., has resigned his position with that company and will associate himself with the H. R. Barker Mfg. Company, Lowell, Mass.

It is reported that Arthur MaGonagle, the well-known heating engineer, will hereafter be connected with Isaac Coffin & Co., Boston, with which concern he was formerly identified.

W. C. Higgins, who, as we announced last week, has associated himself with the Magee Furnace Company of Boston, still has his home in Norwich, Conn., though he

expects to move to Boston in a few months, so as to be nearer his place of business.

"Richmond" in red letters on an orange cover refers to Steam and Hot Water Heaters, shown in a new 32-page catalogue which the Richmond Stove Company, Norwich, Conn., are desirous of placing in the hands of every heating contractor who has not received it. It is printed on fine paper with the text and cuts in black and the ratings, dimensions and prices in red. It opens by briefly reviewing several branches of the heating trade, and shows cuts of the different series of Richmond Vertical Sectional Steam and Water Heaters and of their new series of Round Heaters. Their smaller heaters are shown with a new ash pit and an improved grate. The last pages are devoted to testimonials.

Hereafter all plumbers in the city of Milwaukee, Wis., will have to pass an examination before they will be permitted to engage in their trade. A Board of Examiners to test the fitness of plumbers has been organized by the election of George H. Benzenberg as president and F. W. Pripps as secretary. The Board of Public Works and Plumbing Inspector O'Reilly are also members of this Examination Board. Master plumbers must pay a license of $2 and journeymen 50 cents. These licenses are to be renewed annually, at an expense of 50 cents.

Lewis & Kitchen, Kansas City, Mo., have the contract for a steam plant for the Steinacher School.

C. S. Eames, Bridgeport, Conn., is plumbing a fine residence for Dr. Gibney.

George M. Couch, Hartford, Conn., who makes a specialty of the heating apparatus of the Howard Furnace Company, informs us that he has contracts for 16 Howard Furnaces and Combination Heaters.

The new Dale Basin is one of the attractions in the plumbing showroom of C. Hoffman, Jr., 242 Pearl street, New York. The waste operates with a lever that is positive in action and there is no chain to handle. The overflow duct can be easily cleaned, which completes its sanitary features. The trade are invited to investigate it.

H. A. Roth & Co., Elizabeth, N. J., write us that they have the contracts for steam heating plants in the buildings of R. Rindell, P. Keller, A. Durfredick, I. Hillies, McManus Brothers, and the Holy Rosary.

J. F. Gorman, of the Gorman & English Company, Wilkes Barre, Pa., was in New York this week visiting the trade in the interest of the Gorman Radiator Rest, which, he says, is finding favor with the heating contractors. Their catalogue gives full particulars.

T. Guy Haywood, secretary of the Richmond Stove Company, Norwich, Conn., was a visitor at the New York office, 85 Centre street, this week.

Chas. B. Scott & Co., heating contractors, of Scranton, Pa., have opened an office at Room 102 Liberty Building, New York, in charge of H. R. Stickney.

Percy McCallum, the Eastern representative of the Powers Regulator Company, Chicago, was at their New York office, at 54 John street, after an absence of several days spent in Boston adjusting affairs relative to the recent fire at that office.

A well organized movement is in progress to secure the enactment of an ordinance to regulate plumbing at Chattanooga, Tenn.

A. W. Halstead has opened a plumbing and tinning shop on Chestnut street, north side, Roselle, N. J.

The Waco Electrical Supply & Plumbing Company of Waco, Texas, have been incorporated, with a capital stock of $10,000. The incorporators are A. P. Moore, A. P. Duncan and J. J. Juaddell.

The Hart & Crouse Company, Utica, N. Y., inform us of some important heating contracts up the State in which the Royal Boilers will be used, and Manager W. M. Mackay of the New York office supplements the list with some others. Royal Hot Water Heaters will be used in the residences of E. S. Odell, Utica; Fred. Englehart, St. Johnsville, and J. T. Thompson, Oneida, and two No. 79 Steam Boilers will be used in the residence of Robert W. Tailer, at Richfield Springs. Four No. 77 Royal Steam Boilers will be used for heating the Hagadorn Building, Brooklyn; two No. 96 Royal in the Kindergarten School, Rivington street; two No. 90 Royal in the Gerry office building, New York, and a No. 57 Royal Hot Water Heater in the residence of Professor Hutton of Columbia College. Hornbaker & Bowers, Washington, N. J., are using a No. 77 Royal Steam Boiler for heating the First National Bank building. H. S. Brower, Gifford's, Staten Island, N. Y., is using a Steam Royal for heating the new school building. W. H. Dickinson & Co., Jersey City, N. J., are using a No. 69 Steam Royal for heating the residence of E. Price. Carmichael & Co., New York, are using a No. 49 Royal Hot Water Heater for Sunnyside, historic as the residence of Washington Irving, at Tarrytown, N. Y.

An Improvement in Galvanizing.*

BY GEORGE REESE.

The object of this paper is to call attention to a recent advance in the art of galvanizing, by which many objectionable features are obviated which have heretofore characterized the methods of manufacturing generally in use, thereby insuring not only greater rapidity of production, better quality of product, economy of fuel, labor, capital, interest and other charges, but also resulting in the production of new forms of galvanized wire or coated material hitherto unknown to the trade.

For certain special uses of iron and steel it is desirable, in many cases, to give the metal a coating which will be a protection from oxidation, and at the same time facilitate the uniting of different parts by soldering the coatings together. This is effected by immersing the iron, after it has been properly cleansed and prepared, in a bath of molten zinc, whereby a coating of zinc is obtained which firmly adheres to the iron, by reason of the alloying action between the two metals. This operation is universally known as galvanizing (which, it may be remarked incidentally, is a misnomer), and differs very little from tinning and lead coating. The protection from oxidation, in galvanized wire, is fully accomplished when a very thin and uniform coating is obtained; but where the wire is afterward to be subjected to twisting and bending, such as twisting the ends of telegraph wires together, or the weaving of wire cloth, the wire should be soft and the zinc as pure as possible, so that the elongation of the two metals are as nearly equal as possible, otherwise the coating is liable to crack and peel off. In galvanizing it is necessary that the iron operated on should remain in the bath until it acquires the same temperature as the molten metal, or the coating will not adhere; this, in the case of galvanized wire, necessitates the maintenance of large tanks of molten zinc, containing often as much as 50 to 60 tons of metal.

In the usual method as heretofore practiced, a number of previously prepared wires are drawn slowly through the molten bath of coating metal, and, upon emerging therefrom, are passed through tightly enveloping wipers of asbestos or other material to remove the excess of coating upon their surfaces. This method is necessarily slow, because the time of transit through the bath is fixed by the fact that the temperature of the wire must be raised to, or approximately to, that of the spelter in order that it may receive a thin, durable coating, and also because of the frequent breakage of the wires from the tension exerted upon them by the action of the drawing and reeling devices. The speed at which No. 12 wire is coated being from about 50 to 60 feet per minute, this gauge runs from ¼ to ½ mile, and smaller gauges several miles in length, per bundle. Hence, although many devices have been adopted for increasing the production and decreasing the breakage, by complicated apparatus for drawing larger numbers of wires through the bath and the wipers, and by giving notice of undue strain exerted upon the wires by tension, the output of each bath was and necessarily will be low, in the use of this old method. This in itself called for the use of a large number of galvanizing pots in order to bring up the output of the factory to the paying point. Any increase in the speed of drawing inevitably requires a corresponding increase in the length of the pots because the time of transit through the bath cannot be shortened below the limit before mentioned. The maintenance of an enormous tonnage of spelter in a fluid condition, constantly exposed to oxidation and to the destructive alloying action of the metallic surfaces of the pots, entails great loss, trouble and annoyance by the rapid formation of dross and oxides The percentage of dross should be kept as low as possible to insure proper fluidity and working of the bath. This dross consists mainly of spelter, which granulates after alloying with a very small percentage of iron, and, being heavier than the pure spelter, sinks to the bottom of the bath. Its formation, in conjunction with the necessity of drawing the wires slowly through long, deep, wide baths, has entailed great loss. It will be seen, therefore, that the method of drawing wire through a bath and wipers is radically defective in its principle of operation, of progressively subjecting succeeding portions of the coating to the action of the wipers by tension, apart from any defects in apparatus used for such purpose; yet, notwithstanding, it has continued in use as the only practical method heretofore known to the art for giving a good and reasonably uniform coating to ordinary or fine wire.

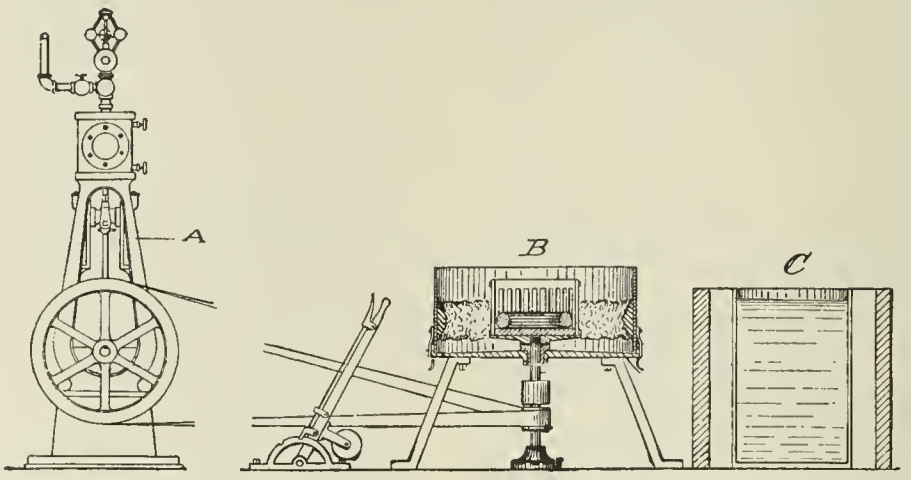
By a newly patented method, the practicability of which has been demonstrated at the works of the Sharon Hill Galvanizing Company, Darby, Pa., wire can be coated in a cheap, rapid and efficient manner at a speed heretofore impossible to attain, and of a quality, uniformity and finish of coating unequaled by that of the wiping process. This is done by a method of operation which

* A paper read before the Franklin Institute, Philadelphia.

prevents the breakage by tension and the imperfect ends which occur in the wiping method; it obviates also the necessity of keeping a large tonnage of spelter constantly heated and exposed to the formation of dross by alloying and oxidation, reduces investment, capital, interest, fuel, labor and other incidental charges, and enables the manufacturer, with a small cheap plant, to exceed the output of the large costly plants now in use. The securing of these results is obtained by a radical departure from the principle of operation of the old wiping method of progressively applying tractive force to successive parts of the wire or bundles; and in lieu thereof each and every part of the coating upon the wire is simultaneously subjected to the action of a centrifugal strain greater than the combined adhesive and capillary attraction acting to retain the superfluous material upon the surface of the wire or between the strands of the bundle, thereby leaving a smooth, flexible, adherent and uniform coating upon the surface of the product. This is effected by means of an apparatus shown herewith, in which A represents the motive power, B a centrifugal separator, which is generally known as a hydro-extractor, and C the galvanizing bath.

tion of the first cost, cost of repairs, fuel and labor. As few and comparatively small pots are used, but little spelter is required to be kept constantly in a molten condition, subject to continual oxidation and the formation of dross from the alloying action of the metal of the pots. The large amount of capital heretofore required to purchase and maintain in a fluid condition the large tonnage of spelter in comparison with the output, is not required for such purpose. Like the old wiping process, it produces a smooth, uniform, flexible coat of galvanizing material upon the wire, but has the advantage of having no breakage from tension and no waste ends on the bundles; finally, it saves capital on account of diminished labor, fuel consumption and power, concentrates the size of plant, requires less ground, fewer buildings, repairs, &c., and enables the manufacturer of galvanized wire to produce, in a cheap and rapid manner, many forms of wire heretofore unknown to the trade.

Among the new articles produced by this method is barbed wire, which has been galvanized after it has been twisted into shape and formed into bundles. When wire is galvanized before being barbed and twisted, much of the



THE REESE GALVANIZING APPARATUS.

The coils or bundles of wire are cleansed by acid and prepared in the usual manner to receive their coating. A whole bundle is then dipped into the bath of melted spelter, and when it has received a thorough coating it is removed to and dropped into the centrifugal separator, which may be in motion for small light coils, or the machine may be started after heavy bundles are placed in it. After a short time the wire attains the same speed as the machine and the surplus coating is almost instantly thrown off against the safety shield. The machine is then stopped and the bundle removed. This part of the process is performed as quickly as possible, in order that none of the coating may solidify until after its removal from the machine. The wire is then subjected to an operation designed to prevent the strands from becoming welded together when such solidification takes place. This is accomplished by jarring the bundle on a block to keep the different strands in motion or separated from each other, or by unwinding the bundle and rewinding it in such a manner that the coating may solidify while in transit from the unwinding to the rewinding reels.

In practice it has been found that a speed of 750 revolutions per minute is sufficiently high to do good work on No. 20 wire in bundles of 10 inches diameter. Larger gauges require less speed, because the wire retains the heat longer and because less capillary attraction is exerted where the spaces between the wires are greater; variation of the initial heat of the bath also causes variation in the cohesive force of the spelter, and variation of the chemical constituents of the bath is also a factor, as some baths work more fluid than others at a given temperature. Smaller gauges of wire and smaller bundles also call for an increased speed of rotation; but in general I have found that the minimum and maximum speed of rotation required are about 500 and 1500 revolutions per minute when operating on 10-inch bundles.

The chief advantages of this method are: As it is only necessary to subject an entire bundle of wire for a few seconds of time to the action of the centrifugal separator instead of drawing a small number of strands through wipers at the slow speed of not more than 1 foot per second, as in the old wiping process, the bundles are finished as fast as they can be raised to the proper temperature and coated in the galvanizing bath, hence the tonnage output per pot is enormously increased, especially so on fine wires, some of which are many thousands of feet in length to the single pound, and which could not be made for general consumption on account of the prohibitive price of such galvanizing product. The vast increase of product from each pot renders few of them necessary in plants of large tonnage capacity, thereby saving a large proportion of the first cost, cost of repairs, fuel and labor. As few and comparatively small pots are used, but little spelter is required to be kept constantly in a molten condition, subject to continual oxidation and the formation of dross from the alloying action of the metal of the pots. The large amount of capital heretofore required to purchase and maintain in a fluid condition the large tonnage of spelter in comparison with the output, is not required for such purpose. Like the old wiping process, it produces a smooth, uniform, flexible coat of galvanizing material upon the wire, but has the advantage of having no breakage from tension and no waste ends on the bundles; finally, it saves capital on account of diminished labor, fuel consumption and power, concentrates the size of plant, requires less ground, fewer buildings, repairs, &c., and enables the manufacturer of galvanized wire to produce, in a cheap and rapid manner, many forms of wire heretofore unknown to the trade.

Among the new articles produced by this method is barbed wire, which has been galvanized after it has been twisted into shape and formed into bundles. When wire is galvanized before being barbed and twisted, much of the coating cracks and peels off and the points of the barbs where they are not coated, become blunt by rusting. This new article cannot only be produced much more cheaply, but is also more durable, and, as the points of the barbs are completely coated, it retains its efficiency much longer than the old kind. Twisted fence bands are rapidly galvanized in the bundle by this method after they are formed. Samples of wire rope illustrate in a remarkable manner how perfectly the superfluous coating material may be eliminated by centrifugal action and yet leave a perfect coating upon the wires. Wire cloth is galvanized by the old method from two meshes to eight meshes per lineal inch; but in cloth finer than eight meshes so many of the meshes become permanently closed with the coating material that it is impossible to produce a marketable article. By the new method cloth of any fineness may be coated if the speed of rotation be increased with the fineness of the cloth operated on. There have been produced samples of 12 x 13 fly wire and No. 16 mesh, which I believe was the first cloth of this kind ever successfully galvanized after being woven.

A plan is being worked out for using some of the power of the James River at Richmond to generate electric power for transmission to consumers in the neighborhood. The General Electric Company have made provisional contracts with consumers to the amount of about 2500 estimated horse-power. It is estimated that they must get contracts for 3500 to 4500 horse-power before beginning work. The company are now applying for a franchise from the City Council and expect to apply for a charter at the next session of the Virginia Legislature. There is a possible development by using a system of storage of from 12,000 to 15,000 horse power the year through.

The important Belgian engineering firm, the Cockerill Company of Seraing, near Liege, have declared a dividend of 20 per cent. for 1896-97, as against 16 per cent. for 1895-96. The directors have also decided to propose an increase of the share capital from 7,500,000 francs to 10,000,000 francs, by the issue of 5000 new shares of 500 francs, to be offered to the present shareholders at a price yet to be fixed. This increase is to provide funds for the considerable extension of the company's mining operations recently undertaken, for the establishment of their Ostend-Tilbury steamship service, for the erection of new basic Bessemer steel works and for the enlargement of the gun factory.

Bids are soon to be called for on the elevation of the Erie Railroad tracks at Jersey City, N. J.

TIN PLATES.

THE METAL WORKER QUARTERLY LIST OF AMERICAN TIN PLATE WORKS.

Herewith are presented for the information of our readers *The Metal Worker's* regular quarterly lists of American tin plate mills and dipping works, together with the brands of tin and terne plates made by each. These lists, which are revised and corrected to October 1, 1897, fully illustrate the existing condition of the American tin plate industry and show a gratifying degree of progress in this department during the last three months. The information contained in them was secured directly from the various manufacturers within the past few days and may be taken as absolutely accurate.

The present lists show that there are now 69 complete plants engaged in the manufacture of tin plate or black plate for tinning purposes in the United States. Forty of these are tin plate plants proper, rolling their own black plate, 35 of which are also tinning their product and finishing it for the market. Five works are as yet unprovided with tinning facilities, and dispose of their black plate to the dipping works. These 40 black plate plants possess 211 complete hot mills, and three of them are adding to their equipment 10 new mills. In addition, three new black plate plants, with an aggregate of 12 mills, are building, making a grand total of 233 hot mills in 43 separate plants run by 41 firms, as against 40 works with 211 hot mills completed and building on July 1, 1897. This is a net increase for the quarter of three works and 22 mills.

Of the 40 black plate plants, three small works, with an aggregate of six hot mills, are not in operation, by reason, mainly, of unfavorable location, and report no present prospect of running. The temporary idleness of about 15 other mills at various works, owing to transient causes, mainly the difficulty of obtaining a sufficient supply of steel, leaves a total of 190 mills in active operation on October 1. This is by far the largest capacity ever employed at one time in the history of the American tin plate industry, representing at a conservative estimate a current output of domestic tin plate at the rate of about 5,400,000 boxes a year, with a potential output for the finished mills (if they were all in operation to their extreme capacity) of quite 6,300,000 boxes annually. Adding the mills now under construction, which will nearly all be ready for work by the end of the year, the American tin plate industry should then be able to turn out close on 7,000, 000 boxes a year.

The numbers of dipping works, 29, and of tinning sets embraced in their equipment, 165, remain unchanged from those given three months ago. Several of these concerns are idle, and others only partially employed, many to but one-fourth to one-third of their capacity. Comparatively few of them are working to anything like their full extent, the exceptions being those which have established a reputation for high grade roofing plates or other specialties. In the manufacture of the ordinary commercial plates they cut but a small figure as compared with the mills.

As indicated above, the American tin plate industry has made substantial advances during the past three months, 15 new tin mills having been completed and added to the producing force in the quarter by the following concerns :

American Tin Plate Company	1
Falcon Sheet & Tin Plate Company	2
Licking Rolling Mill Company	1
Marshall Bros Company	2
New Castle Steel & Tin Plate Company	2
Washington Steel & Tin plate Mills	2
Cincinnati Rolling Mill & Tin Plate Company	3
Whitaker Iron Company	2

In the case of the two last named concerns, sheet mills were converted into black plate mills. The names of three new concerns have been added to our list—namely, the Cincinnati Rolling Mill & Tin Plate Company, Cincinnati, Ohio ; Hamilton & Co., West Newton, Pa., and Zug & Co., Limited, Pittsburgh, Pa. The two latter firms are each constructing a two-mill plant. The National Tin Plate Company's new eight-mill works, at Menessen, Pa., have made substantial progress toward completion. During the quarter the erection of additional hot mills has been begun at the following works : American Tin Plate Company, Elwood, Ind., 2 ; Crescent Sheet & Tin Plate Company, Cincinnati, Ohio, 2, and the La Belle Iron Works, Wheeling, W. Va., 6. The Laughlin Nail Company, Martin's Ferry, Ohio, are preparing to build a new six-mill plant, duplicating their present works. The Britton Rolling Mill Company, Cleveland, Ohio, have added a tinning plant to their equipment, and now finish their own black plate. Several more of the existing works are contemplating extensions to be undertaken at an early date, while there is a good prospect of tin plate works. now projected, being established at New Castle, Pa.; Johnstown, Pa.; Youngstown, Ohio, and other points.

Tin Plate Mills in Need of Steel.

The tin plate makers are seriously hampered just now by the difficulty of obtaining a sufficient supply of steel. The steel mills are so full of business that they seem unable to meet the requirements of the tin plate mills for bars. They are also much behind in making deliveries on contracts placed by the tin plate makers earlier in the year. The consequence is that some of the works have had to close down for the time a part of their capacity, while others are running irregularly, getting their bars in a hand to mouth way, starting and stopping after a few days' run. This is a very unsatisfactory state of things, and is also an expensive method of working. The present difficulty not unnaturally leads some of the tin plate makers to consider the advisability of putting in their own bar mills, so as to be independent in this respect. But those works which are furnished with bar mills are also finding a difficulty in securing enough steel billets to supply their requirements.

New Black Plate Plant.

Zug & Co., Limited, of Pittsburgh, will shortly be prepared to furnish black plate for tinning, and are now installing the necessary equipment. Two gas producers are being erected by Wm. Swindell & Brothers, engineers and contractors, of Pittsburgh. A heating furnace and an annealing furnace are also being built, and work has been commenced on a pickling vat. Two additional stands of rolls are being furnished by Mackintosh, Hemphill & Co. and an electric light plant is being installed, and electric cranes will hereafter be used in all departments of the plant. A large warehouse is being constructed and railroad switches are being built. The capacity of the plant will be increased one-half.

At the plant of the Beaver Tin Plate Company, Lisbon, Ohio, an accident occurred recently which disabled the engine driving the six hot mills. The breakage while not of a serious is of an annoying nature and caused a shut down of the hot mills for about ten days. As soon as necessary repairs can be made the plant will be put in operation again double turn in all departments, as the concern have a considerable number of orders on their books.

The Metal Worker Quarterly List of American Tin Plate Works.

OCTOBER 2, 1897.

SCRAP.

The Licking Rolling Mill Company have had 30 arc lights of 1000 candle power placed in their Tin mill department at the foot of Eleventh street, Covington, Ky., in order to furnish light for continuous operation. The company are running triple turns of eight hours each. They have orders sufficient to keep the Tin mills in operation to December 1.

The Laughlin Nail Company, Wheeling, W Va., manufacturers of Tin and Terne Plates, with plant at Martin's Ferry, Ohio, are getting ready to build and equip another six-mill Tin Plate plant similar to the one they now have in operation. They hope to be ready to enter the market with product from the new plant about May 1, 1898.

The *Industrial World* of Swansea says that "a regular stream of Tin Platers" is again leaving the Welsh shores for America, going from Llanelly, Garnant, Crombwrla and other places.

The British Board of Trade figures relating to the Welsh Tin Plate industry, including returns from owners of 55 Tin Plate works, show that 10,730 persons were employed at the end of August, or 42 less than in July, and 2005 less than at the end of August, 1896.

Marshall Bros. & Co., Philadelphia, have just completed the installment of two new hot mills in their Tin Plate plant. This gives them an equipment of six mills with a weekly capacity of 3500 to 4000 boxes of Tin Plate.

Tests of Aluminum Utensils.

Several processes have been proposed of late years, says a French writer, quoted in *L'Aluminium* of Paris, for ascertaining the impurities contained in the aluminum of commerce. These processes, and particularly that of Monsieur Moissan, may give good results, but they occupy a great deal of time. I have sought out a more practical method of satisfying myself, immediately they are received, whether the various utensils of aluminum used today in the [French] army, such as drinking cups, measures, mess tins, saucepans, cans, &c., fulfill exactly the conditions imposed by the specifications. The metal employed is aluminum alloyed with copper.

In the first place, the aluminum should be of the standard of $\frac{995}{1000}$ with an allowance of not more than $\frac{5}{1000}$—that is to say, it should contain 99 to 99½ per cent. of pure aluminum. In the second place, a proportion of 2 to 3 per cent. of copper should be contained in it. The utensils should not be subjected to scouring with soda.

It is after having studied the action on these aluminums, under heat and cold, of muriatic acid, in degrees of dilution ranging from 1 to 25 parts of acid to 100 parts of water, that I have adopted the following system :

Simple Aluminum.—I put into a phial ½ gram (8 grains) of the metal cut into minute pieces, then add 50 parts of distilled water to 10 parts of pure muriatic acid. The action of the liquid is not slow to manifest itself and becomes more and more apparent as the liquid heats. So soon as the discharge of gas begins to slacken I take the phial to the stove at a temperature below 200 degrees F., and do not take it off until all discharge of gas has ceased. Under these conditions the silicon, the carbon and the copper are not attacked. They are collected by filtration, washed and weighed after calcination.

In order to ascertain the quantity of iron, I add to half the filtered liquid, including the water used for washing, not more than 10 per cent. of potash, sufficient to dissolve the aluminum, and leave it on the stove for half an hour. I collect, on a small filter without folds, the ocherous deposit which has collected at the bottom of the vessel. I wash it in hot distilled water and pour on the filter some drops of muriatic acid 5 per cent. pure, in order to entirely dissolve the contents. I recover a part of the acidulated liquid which has passed through the filter; then, as before, I add a proportion of potash. This is put on the stove, and when the deposit of oxide of iron thus extracted from the aluminum is well assembled, it is separated by the filter and washed to eliminate all traces of potash and weighed, after being calcined on a plate of platinum.

In the other half of the original liquid I find at the same time the aluminum and the iron, according to the regular process, by adding when warm a small amount of pure ammonia. By deducting from the weight ascertained the weight of the oxide previously obtained, I have the weight of the aluminum alone, and by calculation the proportion of pure aluminum.

The French industry actually furnishes aluminums which dissolve almost entirely, cold, in muriatic acid at 20 per cent., often leaving nothing but a very slight black deposit, scarcely appreciable in the scales. The silicon, the carbon and the copper have almost disappeared. The iron, which it is of not less interest to see disappear, has diminished considerably, but in this respect the progress accomplished is less marked than in the case of silicon. From $1\frac{2}{10}$ grams (18½ grains) which I found in 1891, it has only fallen to ½ gram (7¾ grains).

Aluminum Alloyed with Copper.—I put into two flasks ½ gram (8 grains) of the metal cut in small pieces, adding 50 parts of distilled water and only 5 parts of pure muriatic acid. The action is produced more rapidly than with aluminum alone. When the discharge of gas begins to abate the flasks are taken to the stove at a temperature below 200 degrees F., and they are taken off again when no more gaseous bubbles are observed. The operation lasts less than an hour. The copper remains absolutely intact in the form of a spongy, reddish mass. The contents of one of the phials is poured on a smooth filter and the deposit is washed in warm distilled water, calcined and weighed. In the filtered liquid is ascertained as before described the amount of iron and aluminum.

The other phial enables me to ascertain the presence of silicon or of carbon. With this object I add 25 to 30 drops of pure nitric acid and warm the liquid moderately over an open fire. In a few minutes all the copper will disappear, and only the silicon and the carbon will remain, which may be collected in a filter and weighed after washing and calcining.

Action of the Bunsen Burner.

In a lecture before the English Society of Arts, Prof. Vivian B. Lewis gives the following explanation of the action of the Bunsen burner of the cylindrical type :

In a Bunsen burner the chemical action which gives rise to the heating consists of two distinct combustions. The first takes place on the surface of the inner visible cone of the flame. Here the hydrogen and hydrocarbons of the coal gas undergo a partial combustion at the expense of the oxygen of the air, which has been previously mixed with the coal gas. This results in the combustion of the carbon to a mixture of carbon monoxide and dioxide, while some of the hydrogen is burned to water vapor. The outer flame is produced by the combustion of the hydrogen and carbon monoxide, escaping from the inner zone into the completed products of combustion, carbon dioxide and water vapor.

The characteristic appearance of the Bunsen flame varies according to the amount of air which is allowed to enter with the gas. Under normal conditions the zones of flame have a violet blue color, while as more and more air is allowed to enter with the gas the flame becomes fiercer and the inner zone acquires a green tint, and a still further addition of air causes the mixture to become so highly explosive that it flashes back into the tube of the burner. During this change in the color of the flame alterations are taking place in the temperature which the various parts of flame are emitting. The following table gives an approximate idea of the increase that takes place with the addition of more and more air, and which reaches its maximum as an explosive limit is approached :

Temperatures of Bunsen Flame with Blue and Greenish Inner Cones.

	Blue inner cone.	Greenish inner cone.
Tip of inner cone	1,090°	1,575°
Center of outer cone	1,533°	1,630°
Tip of outer cone	1,175°	1,545°
Side of outer cone, level with tip of inner cone	1,333°	1,511°

The ratio of gas to air in the blue and greenish non-luminous combustion is about—in the blue 1 volume of gas to 2.27 of air, and in the green 1 volume of gas to 3.37 of air.

The reason of this increase of temperature is that the less air that is supplied to the center of the flame the more has to be introduced from the exterior, and while the interior supply has been heated in its passage up the hot tube and by partial combustion in the inner zone, the outer supply is cold ; and as not only the oxygen which is used by the flame, but also four times its volume of diluting nitrogen, has to be heated, it is manifest that the less external air that is sucked into the flame the higher will the temperature of the external portion of the flame become ; and as it is this part of the flame which is utilized for heating incandescent mantles, it is clear that this will give a gain in the amount of light to be obtained from the mantle itself.

In the Bandsept burner it is possible to so regulate the mixture of the air and gas that not only is the green zone in the interior of the flame formed, but owing to the explosive point being reached it is drawn down on to the surface of the top of the gauze forming the atomizers, or mixers, through which, however, it is unable to pass. The flame then consists of what is, practically, only the outer cone of the ordinary Bunsen, and, being fairly homogeneous, has a greater equality in temperature than can be obtained with the ordinary flame.

THE RETAIL STORE.

The Monarch Blue Flame Oil Heater.

The Monarch Stove Company of Mansfield, Ohio, have made a radical departure in the way of oil heating stoves, and have brought out the Monarch Blue Flame heater,

The Monarch Blue Flame Oil Heater.—Fig. 1.—Drum Tilted Back for Lighting or Cleaning the Burner.

views of which are presented in the accompanying illustrations. We understand that the heater was placed upon the market last year, but in the rush to bring it out in time for the season's trade the manufacturers constructed

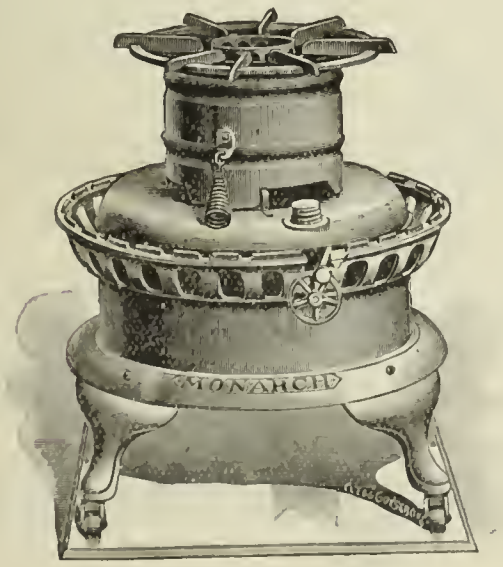

Fig. 2.—Stove with Drum Removed and a Grate Placed Over the Burner for Cooking.

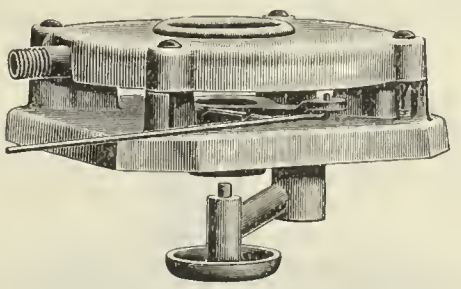
it rather crudely, but now, having had a year's experience, they are placing the stove in the hands of the trade with some very important improvements, which, it is claimed, render it in every way desirable. The success of the blue flame burner on the many cook stoves that have been sold during the past two years makes the company feel certain that the Monarch heater, constructed on the same principle, will meet with a gratifying reception. In fact, they advise us that the sales of the stove thus far have been unusual, and that dealers are finding it profitable to handle by reason of the fact that "it is different from anything on the market." Fig. 1 of the illustrations shows the stove with the top tilted back for lighting or cleaning the burner, while in Fig. 2 the stove is shown provided with a grate for cooking purposes. The Monarch Stove Company are sending out a very attractively printed circular descriptive of this heater, and are said to be receiving a vast number of inquiries from the trade in regard to the stove. The latter is attractive in its general appearance and the combination of a cook stove with a heater is one of the points which cannot fail to command the attention of the trade.

The Van Duzen Oil Gas Burner.

In the accompanying illustration we present a genera view of a new form of oil gas burner which has been brought out by the firm of Van Dusen & Mersfelder, 437



The Van Duzen Oil Gas Burner.

Main street, Cincinnati, Ohio. The manufacturers claim for this device that it is always ready for use, is more economical than any other method of generating heat for furnaces, cook stoves, ranges, heaters or fire places, and that its simplicity is such that it may be readily installed in any kind of cooking or heating device without deranging or altering the latter, while its use avoids the necessity of handling coal, wood or ashes. In operating the device a small amount of oil is allowed to drip into the drip cup and lighted in the usual manner; the burning of this, heating the generator coil located under the top plate, produces a clear, bright gas flame, which is said to be free from carbon and of intense heating capacity.

Aluminum Hotel Saucepan.

The Griswold Mfg. Company, Erie, Pa., have lately added to their list of Erie cast aluminum ware a full line of hotel saucepans similar to the one shown in the accom-

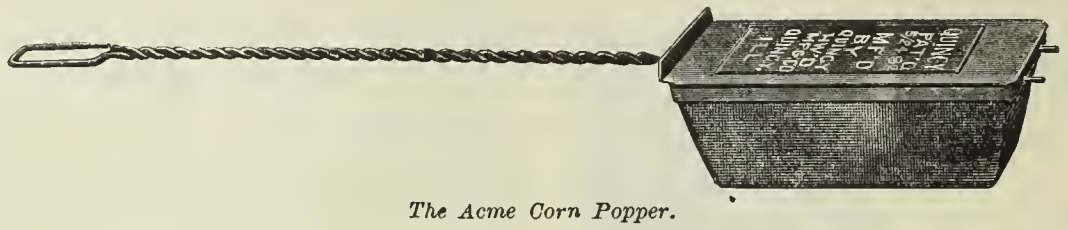
Aluminum Hotel Saucepan.

panying cut. These utensils are made in 12 sizes, of four diameters and three depths of each size. They are equipped with heavy iron tinned handles and cast extra heavy on the bottom to stand the rough usage of hotels. The method of attaching the handle to the body of the pan is a special feature. They are riveted by large rivets cast on the pans, leaving no joints to leak and no rivet

heads inside the utensil. These pans have been already put to use in some of the large hotels of the country, and the company have received very flattering testimonials indorsing them. Being cast they are very strong and stiff and will stand great heat and severe usage. They do away also with the necessity of being constantly retinned, which attaches to copper saucepans, while there is no poisonous substance in the metal. The Griswold Mfg. Company are just getting out a new catalogue of their full line of cast aluminum goods.

The Acme Corn Popper.

The Quincy Hardware Mfg. Company, Quincy, Ill., are putting on the market the corn popper shown herewith. It is made entirely of metal, including the handle, in full

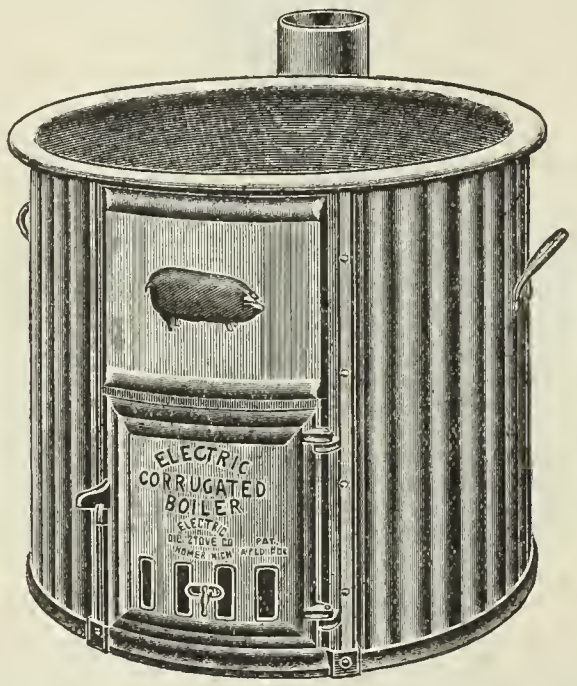


The Acme Corn Popper.

sizes 1 and 2 quart. The point is made that the handle cannot burn or come off. For shipping the poppers are nested 1 gross in a box. The popper is referred to as a good article which is sold for less money than their Quincy popper. The latter is shaken by a crank and gear attachment fastened to the handle. It is being made for 1897 with a solid tin lid, which, it is stated, will not fly off. Prices have also been reduced for this year.

The Electric Corrugated Boiler and Feed Cooker.

The Electric Oil Stove Company, Homer, Mich., are manufacturing the corrugated boiler and feed cooker



The Electric Corrugated Boiler and Feed Cooker.

herewith illustrated. It consists of a cast iron kettle supported on a very heavy steel fire box. The jacket of the fire box is corrugated, thus providing for expansion and contraction and insuring durability. The construction of the fire box is such that the heat is applied to the whole exterior surface of the kettle. The kettle is cast of the finest grades of iron and is specially designed for service and durability. The door frame is of cast iron and the door is large. Malleable iron handles are attached to the sides of the fire box. Three sizes are made, holding 40, 60 and 70 gallons respectively.

MEMORANDA.

We have received from the National Wringer & Mfg. Company, Canton, Ohio, their 1897 catalogue, in which they show their various styles of Wringers, with both malleable iron and wooden frames for attaching to the washtub. Their laundry furniture also includes a Folding Wash Bench with Wringer stand attached, and a Rack for displaying Wringers in stores. They are also manufacturers of standard Wood Faucets, which they say are made of the best dry butternut lumber. The last page gives a price-list of the parts for Wringers. Inclosed with the catalogue is an order blank to facilitate and simplify the work of making up an order for their goods.

Kemp & Co., Tinware manufacturers, 217 Elm street, St. Louis, Mo., have secured a lot 100 x 200 feet on the west side of Second street, where they will erect a new factory.

M. B. Kerr, Winfield, Kan., manufacturer of West's Stove Pipe Lock, advises us that this lock is now thoroughly introduced throughout the central West, and that a number of Eastern jobbers have recently taken the matter up with a view of introducing them through the Eastern States. In the advertisement of West's Stove Pipe Lock, which appears in this issue, the long disputed question as to whether or not marriage is a failure seems to be satisfactorily answered. These locks are packed 1 dozen in nicely labeled box.

J. P. Smith of the Fordyce Hardware Company, Fordyce, Ark., has sold his stock to J. W. Lee and Robert Graham. The firm name continues Fordyce Hardware Company, who will do a retail business in Shelf and Heavy Hardware Stoves, Tinware, Agricultural Implements, Sporting and Athletic Goods and Wagons. They have fitted up the handsomest brick building in Fordyce for the business, with new counters and shelving finished in hard oil, attractive in appearance and modern in style.

M. E. Lewis, who is successor to H. S. Marvin in the Hardware, Stove and Tinware business, at Orange City, Iowa, desires catalogues, &c., from the trade.

F. C. Boise of Union City, Mich., who has lately purchased the Hardware store of Buell & Spring of that place, would be glad to receive catalogues, &c., from manufacturers. Mr. Boise is carrying a stock of Shelf and Heavy Hardware, Stoves, Tinware, Implements, Bicycles, Buggies, &c.

Alfred Cole, Jr., whose Hardware store at 98 Fourth avenue, College Point, N. Y., was damaged by fire on the 13th ult., is continuing business at the old stand and is engaged in making a number of improvements. Mr. Cole would value copies of catalogues, price-lists, &c., relating to Hardware, Stoves, Tinware, House Furnishings, Mill, Factory and Boat Supplies, Plumbing, Roofing, Gas Fitting, &c.

L. S. Palmer has bought out the Hardware, Stove, Tinware, Implement and Sporting Goods stock of G. C. Fuller, Stoutland, Mo. and is continuing at the old stand.

J. F. Kimball, Gilroy, Cal., has been succeeded in the Hardware and Tinware business by A. Robinson. O. H. Dobbs has purchased his wall paper stock, and A. L. Ellis his stock of Implements and extras.

One of our representatives has recently been shown a new article of manufacture which will soon be brought to the general attention of the trade in an early issue. It is what will be known as No. 20 Ferrosteel special sad iron, and we understand its patents are controlled by the Ferrosteel Company of Cleveland, Ohio. It is a beautiful article, and the jobbers to whom it has been shown are very much taken with it, some of them expressing their intention of pushing its sale in place of other irons which they have been handling.

Ellsworth, Myers & Co., dealers in Hardware, Stoves, Buggies, Harness, Implements, &c., Decatur, Ind., have moved into their new store, which is two stories high, with basement. It is equipped with elevator and other modern appliances, and the firm advise us that they are now in good shape to handle their increasing trade. J. E. Ellsworth, the senior member of the firm, has been in business continuously in Decatur for the past 25 years, and is also the principal partner in the firms of J. E. Ellsworth & Co. and Ellsworth & Cline.

J. F. Johnson & Co., dealers in Hardware, Iron, Agricultural Implements, Stoves, Wagons and Wagon Material, &c., Greenville, Ala., have in course of erection a fire proof storage warehouse. The warehouse is situated on the line of the L. & N. Railway and covers an area 54 x 158 feet. This warehouse, in connection with the building they occupy on Commerce sreet, gives the firm a floor space of 11,400 square feet, which space, they advise us, will not more than meet the requirements.

J. D. Price and Samuel Johnson have started in the Hardware business at Bellflower, Ill., under the style of Johnson & Price. They are handling Shelf Hardware,

Stoves and Tinware. They are also doing a plumbing, steam and hot water and warm air furnace heating business, and in connection with this department are manufacturing Price's improved hot water Stove and the Bellflower Incubator, their own inventions. The stove is referred to as a combination hot water heater and radiator on one base.

Surprise Meat Chopper.

Peck, Stow & Wilcox Company, Southington, Conn., and 27 Chambers street, New York, have recently put on

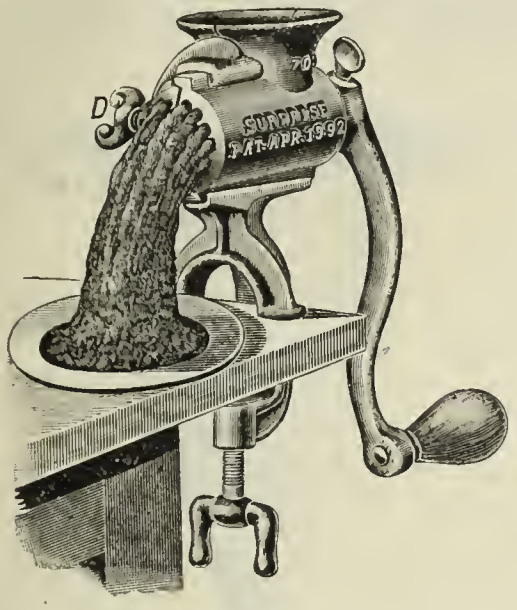


Fig. 1.—Surprise Meat Chopper or Food Cutter.

the market several new meat cutters of their manufacture, two of which are seen in the accompanying engravings. Fig. 1 shows the No. 705 Surprise meat chopper, or food cutter, as it appears in use. Fig. 2 illustrates the entire

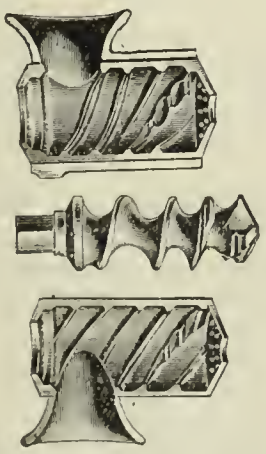

Fig. 2.—Working Parts Surprise Meat Chopper.

working portion of the cutter, which practically consists of the feed screw and shell, the parts being held together by the side thumb screw. The principal feature of this cutter, distinguishing it from others of their make, is

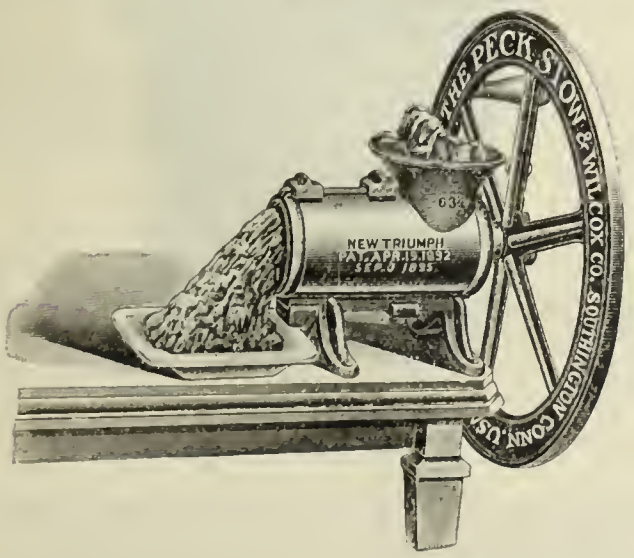

Fig. 3.—New Triumph Meat Cutter with Fly Wheel.

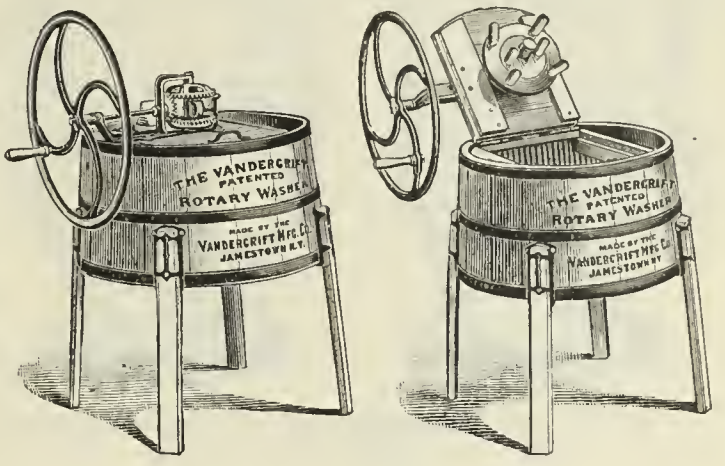
that instead of a detachable plate with holes at the delivery end the same result is accomplished by having the holes drilled in the ends of the two shells or body of cutter. It can be quickly clamped to a table or shelf. The parts are covered with two coats of block tin and it has a capacity of 1½ pounds of meat a minute. Vegetables and various other articles of food can also be cut with it, and when done with the parts can be instantly cleaned. At present it is made in but one size, for family use. Fig. 3 represents the No. 634 New Triumph meat chopper with fly wheel for sausage makers' and butchers' use, each weighing complete 48 pounds. They also make the same cutter worked with a crank, as are the smaller cutters. This is numbered 632 and weighs 21 pounds.

The Vandergrift Rotary Washer.

The Vandergrift Mfg. Company, Jamestown, N. Y., are manufacturing the washing machine shown herewith. It is so arranged that by turning the large balance wheel in one direction the dasher inside the machine reverses or rotates in opposite directions. The balance or fly wheel,

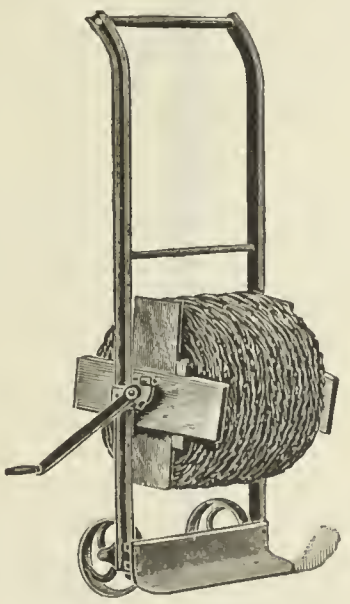


The Vandergrift Rotary Washer.

weighing 17 pounds, is referred to as being of great assistance in causing the washer to turn easily, and can be quickly removed when desired. The point is made that the machine is closed tightly to prevent the escape of steam and to retain the heat in the water; also that it can be operated with ease by any woman.

Farmer's Friend Steel Barb Wire Truck.

Warner Mfg. Company, Freeport, Ill., are introducing the steel barb wire truck shown in the accompanying cut. The truck is for use in building barb wire fence, to dispense with the method of carrying the spool of wire between two men on a stick, and to make the work safe and quick, with but one man to handle the wire. The truck is so arranged, it is shown, that the spool of wire may be picked up from the ground without touching it, and that when the truck is raised up in position the spool is locked in place automatically. The spool may be as readily removed from the truck without touching the wire. The



Farmers' Friend Steel Barb Wire Truck.

crank, which is furnished with each truck, is for use in taking down old fencing, so that the wire may be readily rewound on a spool ready for use, to avoid the loss from tangled wire when taking down in the usual manner. When the spool is removed the truck can be used, it is explained, for trucking grain, moving stoves, boxes, &c.

New Surprise Tubular Lantern.

The Ohio Lantern Company, Tiffin, Ohio, are placing on the market the tubular lantern shown herewith. It is of the standard size for coal oil, provided with a No. 1 burner, 5/8-inch wick and No. 0 globe. In Fig. 2 the lantern is shown open to light, trim, clean or to remove the globe. It can be opened or closed, it is explained, with one hand, and being smooth and perfect it is easy to clean. Every lantern, it is stated, is thoroughly tested and inspected by experienced workmen. The goods are packed in boxes of one-half or one dozen each.

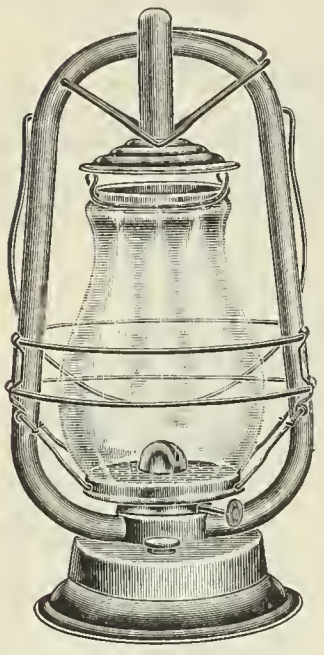


Fig. 1.—New Surprise Tubular Lantern.

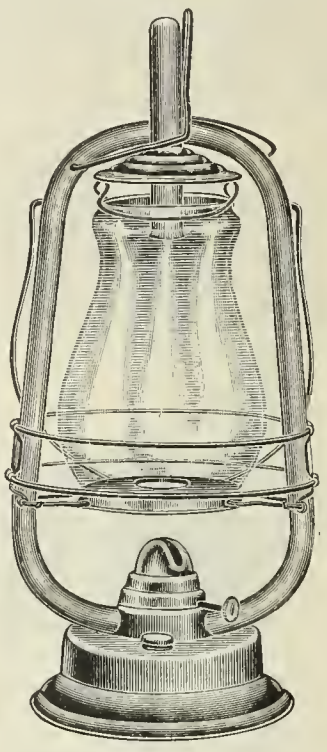

Fig. 2.—New Surprise Lantern Open.

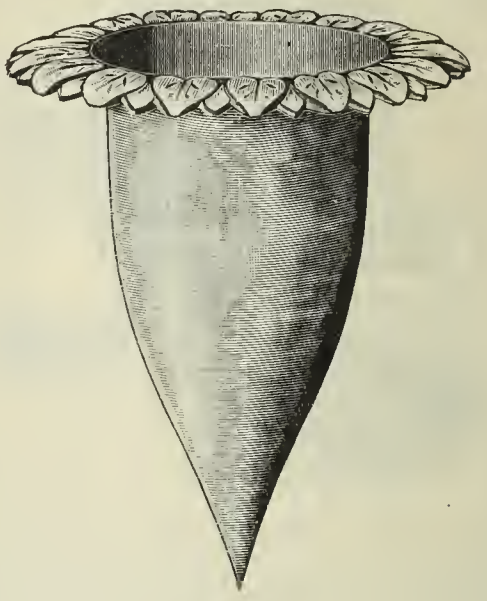
The Fast Mail Double Acting Force Pump.

The force pump illustrated herewith is manufactured by the Flint & Walling Mfg. Company, Kendallville, Ind., and is claimed to be most substantial and unique in construction. The set length, being very compact, can easily be inserted in casing as small as 5 inches in diameter, and is particularly adapted for use in deep wells of 2-inch and larger casing by submerging the cylinder the proper distance. The upper cylinder is made of seamless brass tubing, and, having one-half the capacity of the suction cylinder, a constant and rapid flow of water is insured. The air chamber is of adequate size to act in conjunction with both cylinders, thus insuring to the purchaser perfect ease of operation. Being fitted with hose connection on spout, the pump will be found quite convenient for use in greenhouses, sprinkling lawns, extinguishing fires, washing windows, carriages, and a variety of other purposes where a hand pump is required for forcing water to any desired point about private or public buildings. The pumps are furnished in two styles of finish, either painted or galvanized, as may be desired.

The Fast Mail Double Acting Force Pump.

Bouquet Holder.

The accompanying cut represents a bouquet holder for use in cemeteries, which is put on the market by the Wagner Mfg. Company, Sidney, Ohio. It is of cast iron, made in one solid piece, nicely finished and painted green. It is designed to be sunk in the earth about 1 to 3 inches from the top. The holder is 5½ x 6½ inches in size and contains sufficient water to preserve flowers much longer than if kept in tumblers, which are usually used.



Bouquet Holder.

The Economy Boiler and Feed Cooker.

The accompanying illustration shows the Economy boiler and feed cooker, manufactured by the Economy Mfg. Company, Homer, Mich. It consists of a furnace or jacket and a kettle. The jacket is made of heavy cold rolled steel, supported at the bottom by a heavy wrought iron band. Inside the casing is placed a cast iron flue, which conducts the fire against and around the kettle before the smoke reaches the smoke pipe. The entire outside of the kettle is brought in contact with the fire, and it is claimed that 50 gallons of water can be boiled in 20 to 25 minutes. The fire door is very large, enabling large pieces to be inserted. The kettle is of very smooth cast iron and can be lifted out of the furnace instantly. Three sizes are made, namely, 40, 60 and 70 gallons. The entire hight is but 30 inches, making it very convenient to dip into and out of.

The Economy Boiler and Feed Cooker.

Lizzie A. Reece has removed her Hardware and Stove stock from Walkerton, Ind., to North Liberty, where she is now located.

Stray Thoughts on Collections.

BY L. M. N.

The matter of collections engrosses not a little of the merchant's time and attention.

It is an unwise policy to

ALLOW CUSTOMERS

their own time in making payments. Even where the capital is ample and the merchant may not need to collect his bills promptly, not needing the money, it is best to have a system of collecting accounts when due, and of adhering to that system. Some may argue that it pays to allow debtors the privilege of paying when they get ready, where the capital of the business will permit. They may claim that it makes the house popular with the buying public, and is a means of securing and retaining business ; and that people do not like to be asked for money, and will patronize the house where they can have their own terms.

THIN SKINNED PEOPLE.

Now, while we may admit that there is some truth in this, and that it is a delicate matter to collect from some thin skinned people (in regard to their money obligations), and that in some cases offense may be given, yet it is not a sound principle of business to allow accounts to drag along after the time when they should be paid has arrived.

IMPLIED CONTRACT.

In the sale of a bill of goods there must be a contract between the buyer and seller. This contract may not be in writing or it may not be definitely expressed in words, yet it exists. The seller delivers the goods and the buyer agrees to pay for them at a future specified time. When this time arrives the buyer is expected to fulfill his part of the agreement. If he does not, then as a matter of business the seller should notify him and ask for payment. Now, there are some people who

DECIDEDLY OBJECT

to be reminded that they are owing a bill. Unless they are unusually good customers, who pay good prices and make voluntary settlements in a reasonable time, it does not pay to violate the system merely for the sake of satisfying such whimsical people. Some will recoil at the thought of thus driving away a customer. Perhaps a customer may be lost, and perhaps not. It does not do to be too modest in business ; rights must be maintained to a certain extent. If the matter is explained and it is shown that a system is followed in looking after all accounts that are due, if the person injured is at all reasonable his trade will seldom be lost. This will lead to a better understanding, and the customer may make some arrangement when he will be expected to pay in future, and then it is known what to expect of him.

SENDING STATEMENTS.

But the fear of offending is often more fancied than real. People as a rule expect to pay their bills and have no objections to the merchant sending them statements at regular intervals. In almost every case where people become angry because they are dunned they will prove to be undesirable customers. They take offense, or pretend to be offended, because they have been asked for such a degrading thing as money, and act as if the merchant should consider himself honored by having the opportunity presented him of selling them his wares. The good or bad opinion of such people counts for little.

THE PUBLIC

at this age of the century is too well informed of business methods to take offense at receiving a monthly statement of account. So we again repeat that it does not pay the retailer to be weak kneed in this particular.

A GOOD COLLECTOR.

Send out statements regularly every month or quarter, as may be determined which will best suit the business, and then follow up the statements. Let a polite collector call and the money will come in. There is a great deal in having a good collector. Some young man sent on this errand will do more harm than little. The main requisites of a good collector are that he should be always good natured, be able to make some pleasant or even facetious remark, persistent, and insist upon being told the exact date when he may receive the amount.

CUSTOMERS' EXCUSES.

It does no good to be cross and gruff if he is put off by such remarks as "Never got your bill," "Haven't checked your account yet," "Come in next week," or "I will call in and settle." These and other replies equally evasive are always fired at the new comer, and if he is a little soft he takes them for the solid truth, and thus makes his weary rounds, but fails to collect the cash.

The collector of opposite character who meets such a reception with pert and impudent replies is equally as unsuccessful, and does his employer positive injury as well. The former individual who is so easily "put off" is a great favorite with the people who are not fond of paying their bills promptly. They always meet him with a smile, and keep him calling until his successor is appointed.

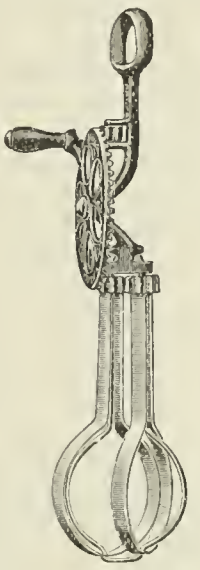
TACT IN COLLECTING.

It requires great tact to collect bills. These people are so polite and seem so anxious to oblige one with that little amount were it in their power, but Mr. So-and So promised them some money last week, but they have not got it yet, and they are actually filled with remorse and shame that they cannot possibly accommodate you to-day. The collector must be able to "size up" his man, and let him understand that though he may put off the other fellow, he has come to collect that bill.

When they find he means business they will pay him or give a date when they will, and in most every case they will do as they say, if the collector has grit and they realize that he will give them no rest until the bill is paid.

New Dover Genuine Egg Beater.

The egg beater shown in the accompanying cut is put on the market by the Dover Stamping Company, Boston, Mass. The improvement consists of a third or idler pinion or cog wheel, the sole purpose of which is to keep the large wheel from working loose and preventing the wear



New Dover Genuine Egg Beater.

on the gears occasioned by constant use, and the consequent slipping out of gear.

Wagner Mfg. Company, manufacturers of Cast Iron and Aluminum Hollow Ware, Sidney, Ohio, advise us that they have made arrangements with W. H. D. Mearns to be their resident agent in New York City and vicinity. Mr. Mearns was for some time the New York representative of the Griswold Mfg. Company. His office address is Room 10, 5 and 7 Dey street, New York City.

Rummel Brothers, Sioux Falls, S. D., issue circulars relating to Queen's Polishing Paste, useful for polishing stoves, silver ware, nickel and similar articles. This paste is manufactured exclusively by Rummel Brothers, and is put on stoves with a damp rag and brushed with a stove brush or rubbed with dry rags. The firm also make Nickel Polish, Bluing, Enameline, Japanese Varnish, &c.

Eb. Butler has bought a half interest in the Dan Henry Stove and Tinware establishment, Greensburg, Ind.

L. F. Currier, Allen's corner, Amesbury, Mass., has commenced the manufacture of a Stove Blacking, which he has named Congo.

Kalp & Mechling, Greensburg, Pa., made a fine display of Garland Stoves at the Youngwood fair.

Steiger & Kerr, Grass Valley, Cal., made an exhibit of their Stoves and Ranges, made in California, at the Mechanics' Fair, and secured three first prizes and one medal.

The task of keeping clean the downtown streets of Chicago has been intrusted by Mayor Harrison to a woman, Mrs. E. A. Paul of that city.

STOVE TRADE NOTES.

LACK OF UNIFORMITY IN STOVE FOUNDRY PRACTICE.

BY THOMAS F. KENNEDY.

An article printed in *The Metal Worker* of July 3 last cites a few instances in support of the statement that "The most striking characteristic of the stove foundries of this country is the prevailing lack of uniformity in method and practice." The closing paragraph of the same article says: "Circumstances and local conditions might properly modify practice, but this would only account for a small part; the greater part remains to be accounted for in other ways." It is my purpose now to inquire as to what may be some of the causes of this, outside of circumstances and local conditions. I attribute it to the entire absence of accumulated knowledge except in the form of tradition. If one examines a catalogue of any public library or of some of the publishing houses, books can be found treating of the minutest divisions and subdivisions of the different branches of the mechanic arts, commerce and agriculture. There is an abundant literature on the subject of founding, in the form of histories, treatises and practical works which cover a wide range. Much of this is the gradual accumulation of generations of experience and investigation. Especially is this true of other metals than cast iron, which did not begin to come into general use until the middle of the last century.

Except for the chapter on melting metals to be found in all of the books on foundry practice there is no information in them which is applicable to the stove founding branch of the art. The extensive literature devoted to the engineering branch of founding is easily accounted for. Inventors and engineers, civil and mechanical, as well as students in other branches of the mechanic arts, are all more or less interested in the theory and practice of founding; besides, architects and artists are often dependent on the founder for the success of their design, and to this extent are interested in what relates to founding. All of the earlier writings on founding were by scientists and inventors, though these were for the most part engineers by profession. It was very seldom that any of these men were bound to any one establishment either as owners or regular employees, hence they had no pecuniary interest in concealing any knowledge gained in their experience or through their investigations. On the contrary, they often gained name and fame by publishing it to the world, therefore they had all to gain and nothing to lose by so doing.

On the other hand, the men who built up the American stove business and made the principal improvements in design and methods of manufacture were either owners or part owners of stove foundries or regular employees of these with good salaries, and even if they had the time and inclination and were capable of doing this kind of work, from a pecuniary point of view they had little or nothing to gain, and it is possible that they were often rather inclined to keep a good thing quiet than to advertise it. Whether the true reason or not, this furnishes a plausible and sufficient one for the paucity of writings on the mechanical end of the stove business.

If calamities such as have destroyed civilizations in past ages were to overtake us now the making of stoves, so highly perfected in this country at the present time, would, so far as any writings go that would explain the mysteries of the business, be a lost art.

So far as I know the writings that would throw the most light on the mechanical end are the records of the proceedings of the manufacturers' organizations in the la decade, the papers contributed by members dealing with practical subjects or some phase of these, and the controversies and agreements between the manufacturers and molders. These latter, however, would be more interesting to the student of political economy or social science than to the scientist or the manufacturer.

Imagine the scholar of some future age translating a fragment of some record that refers to tamale stoves. The tamale, as some may not know, is a Mexican dish composed of beef, corn meal and cayenne pepper mixed together, formed into cylinders 1 inch in diameter and 5 or 6 inches long, wrapped in several thicknesses of corn husk and steamed. Our scholar of course would know in what high estimation the tamale was held by our Southern neighbors, and what more natural than the inference that the tamale stoves were to cook tamales?

There is a strong contrast between the numerous writers on foundry practice engaged in the machinery and jobbing branches and the almost entire absence of such among the mechanics employed in the stove business. The ambitious molder with an aptitude for writing, if engaged in the engineering branch of molding, has in an abundant literature an easily accessible mass of information which is an incentive to try his skill with his pen, and of immeasurable value as a guide and model in any work he may undertake in that direction. If writing an article on any current topic, he has a regular glossary of terms, phrases and definitions that are understood wherever the art of founding is known or practiced. If he is advocating a change in practice or formulating a new theory, he can furthermore easily learn how it agrees with the axioms of chemistry and natural philosophy as applied to the art of founding by the authorities from Overman down.

The stove molder has no such fund of knowledge to drawn on. If he undertakes anything in the line of writing he must depend on his own observation and experience to guide him. The tradition mentioned is often confusing and unreliable, and at best must be verified before it is of any practical value.

Another thing to consider is the uncompromising hostility of molders and other workmen to innovations or improvements, on the ground that sooner or later they would prove detrimental to their interests. This, of course, is done in a covert but nevertheless effective manner. A new hand may remark, "They have a better way of making this job at C.'s." Likely as not some one will reply, "Well, keep it to yourself. There is Rooter over there; when he came here five of that job he is making was a day's work. He told of a better way he saw a similar job made, and now he makes eight for a day's work—does nearly twice the work for the same money and keeps another molder out of a job." Out of deference to the wishes of shop mates I have on several occasions refrained from making suggestions to foremen or superintendents with a view to bringing about a change in practice on some point which, if adopted and enforced in a liberal spirit, would be sure to prove mutually advantageous. Observation and experience convince me that while it is to be deplored the prejudice has some foundation in fact. This prejudice minimizes the influence of what might otherwise be a considerable factor in bringing about more uniform practice, the traveling molder. I believe this subject of uniformity one well worthy the attention of stove men, especially of the leading spirits of their organizations.

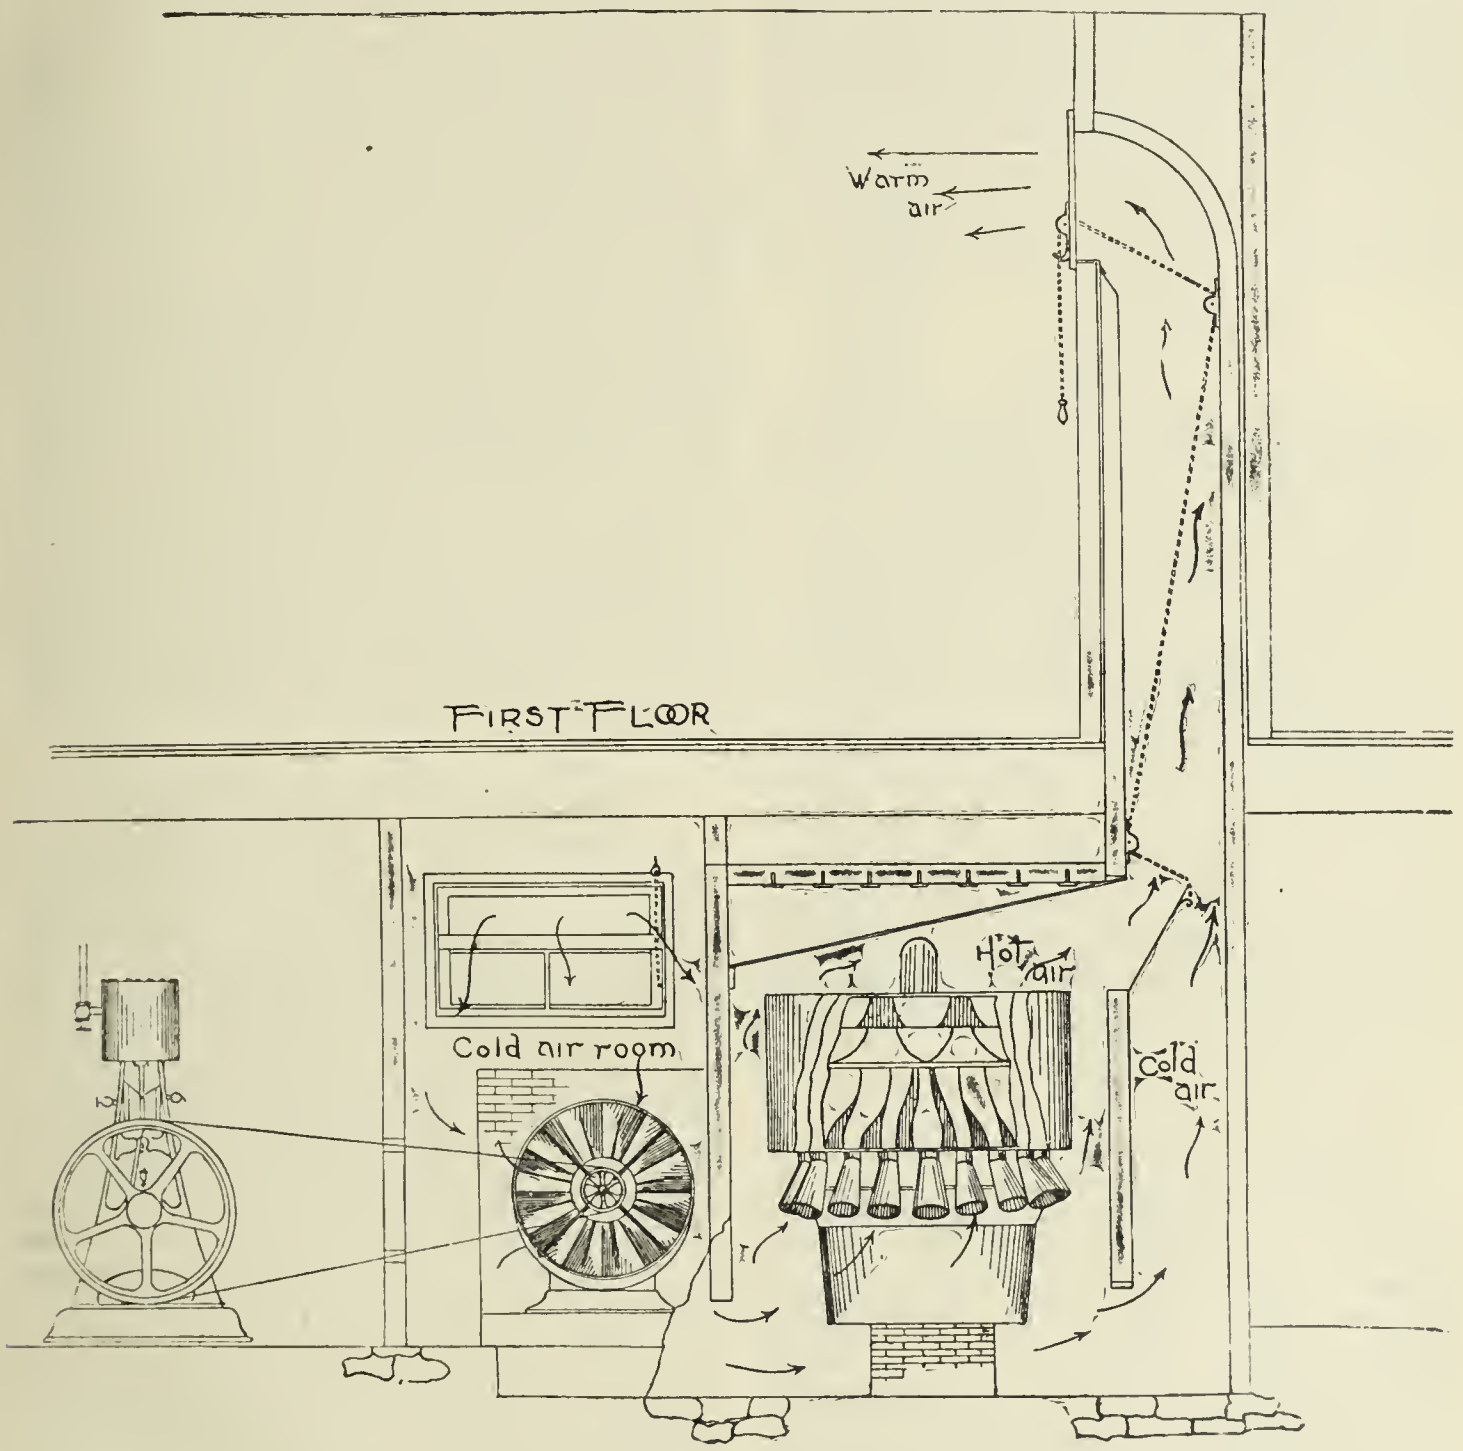
Oblivious of the fact that comparisons are odious, the Gobeille Pattern Company, Cleveland, Ohio, issue a cir-

cular in which they ask the recipient to make out a list of the six leading Stove manufacturers of 1877 and the six leading concerns in the same line to-day. Compare them and from the comparison be taught that nothing is so important as Patterns to the success of a house. This is the deduction of the Gobeille Pattern Company, be it remembered, but as they are in the Pattern business it is quite natural that they should so read history.

Furnace Hot Blast System.

A system of heating which has rapidly grown in popularity as its use and operation have become more generally known is what may be called the furnace hot blast system. Inquiring among the trade two years ago we were able to discover but a single example of this method of heating the details of the system as erected rather than on the principles involved. Since that time numerous furnace hot blast systems have been illustrated and described in *The Metal Worker* and much valuable information on the subject has been presented.

Among the early investigators in this field were the Smith & Anthony Company of Boston, Mass., and numerous systems are now in operation in which their furnaces have been used in connection with fans. One is in a large church in New York City, and others in churches and school houses in different cities in Connecticut and Massachusetts. In the accompanying illustration, which is reproduced from a catalogue entitled "Heating, Ventilation and Sanitation," recently issued by the Smith & Anthony Company, we present a sectional view through a building showing the arrangement of a furnace hot blast



Furnace Hot Blast System.

buildings, though at that time several systems were being installed in churches which had been planned by George W. Kramer, an architect in the Metropolitan Building, New York City. In all buildings where this system of heating was specified it was necessary for the architect to take all responsibility for its success or failure. The introduction of such a system was opposed in New York City by the insurance authorities. The first plants put in operation were contracted for by men who did entirely a heating contracting business, and were not in the ordinary sense manufacturers of furnace goods, furnace manufacturers being more or less doubtful as to the advisability of the use of a fan for forcing air through a furnace, and did not have at their disposal the information for the guidance of their customers in using furnaces of their manufacture in connection with a fan. The first system of this character which was brought to general notice was described in *The Metal Worker* of May 25, 1895, the article dwelling on apparatus. In this instance it will be noticed that a small engine is used to drive the fan, but it has been found in practice that an electric motor, a water motor, a gasoline engine or a steam engine is well adapted for the purpose. In some instances the fan is directly connected with the cold air supply duct, while in others it is set in a room supplied with cold air from out of doors by means of a window. The furnace or furnaces are set in the usual manner, although in some instances it has been thought beneficial to bring the casing of the furnace close to the heating surfaces, in order to force the rapidly traveling air to come in contact with the hot surfaces and to prevent it from passing through the furnace without being properly warmed. In the illustration presented it will be noticed that the system is provided with a mixing damper, so that in case the building becomes warmer than is desirable the temperature may be lowered by the admission of air of a lower temperature. The providing of a by-pass

and a mixing damper also enables the fan to be used in the summer season for cooling the building or changing the air.

In some instances, as has been shown by the plants which have been presented in *The Metal Worker*, the furnaces are set in one group or a battery, and the warmed air is carried to the different parts of the building by means of pipes. In other systems the furnaces have been placed at the base of a series of flues leading to the parts of the building which are to be heated, and some plants have been so arranged that they work either under the gravity or air blast system as occasion may require. It is noticeable that a gravity system will work better in cold weather, when there is a greater difference in the temperature and weight of a given bulk of air outside and in, than in the early fall and late spring, when the indoor temperature is but slightly in excess of that out of doors. Experience with this system of heating has demonstrated that the proper place for the fan to be located is between the air supply and the furnace and not between the furnace and the work to be done, as is the custom with blower systems of steam and hot water heating. Another feature which has been noticed, but which has been treated very conservatively, is that furnaces used in connection with a fan seem to develop their full heating capacity without any increase in the use of fuel, which is in opposition to an often expressed opinion among furnacemen that the use of a fan will bring so much air in contact with the furnace that it will be necessary for a larger size of furnace to be used in heating a given building.

H. H. Culver.

H. H. Culver, vice-president of the Wrought Iron Range Company, St. Louis, died at his residence in that city on Sunday, 26th inst., after an illness of nearly six months. Mr. Culver was born near New London, Ohio, in 1840. He received a common school education, and at the age of 21 years located in Springfield, Ill., where he was employed with the stove and hardware firm of McCreery & Co. In 1864 the Wrought Iron Range Company were established, whose business has since grown to mammoth proportions, the sales averaging a carload of ranges a day for the 365 days of the year. Mr. Culver has been identified with the Wrought Iron Range Company since their inception, and much of the success of this institution is due to the energy and general foresight which were among his chief characteristics. In addition to being a successful business man, Mr. Culver was also a practical philanthropist, giving away vast sums annually, all of which was dispersed without the least ostentation. In 1894 he established the Culver Military Academy at Marmont, Ind., now known as Culver, Ind. The academy is located on spacious grounds overlooking Lake Maxinkuckee, and with the exception of West Point is the largest military academy in the United States. The funeral took place Tuesday, 28th inst., the remains being temporarily placed in the receiving vault in Bellefontaine Cemetery, St. Louis, until arrangements can be perfected to inter them in the grounds of the Culver Military Academy, to rest among those he loved so well.

The March-Brownback Stove Company.

The annual trade catalogue which has just been distributed by the March-Brownback Stove Company of Pottstown, Pa., is something of a departure from the usual run of stove catalogues, and for that reason, if for no other, is likely to attract more than passing attention on the part of those receiving copies. The general shape is oblong and the 191 pages of letterpress are bound in heavy paper covers of deep blue, carrying in white enamel letters the name and address of the company and the number of the catalogue, 49. The printing has been executed with a great deal of care, and no little time and attention has been given by the compiler to the arrangement of the cuts and descriptive matter. For the most part the engravings appear on the right hand pages, while the major portion of the text occupies the left hand pages. The engravings are reproductions from photographs of the stoves, and in connection with the style of type used for the text present a very dainty appearance.

The stoves are divided into two classes—ranges and heaters. The ranges occupy nearly 100 pages of the volume, being offered under such names as the Welcome Globe, shown in a variety of styles and embodying the modern features of construction; the Victor Globe, a new design six hole range with nickel ornamentation; the Prize Globe, for coal or wood; the Solar Globe, which has been constructed with a special view of meeting the requirements of the building trade, and is therefore of special interest to builders, contractors, architects and all others engaged in the erection of buildings; the I X L Globe range, made either right or left hand, and the Prize Expert; a small six hole range of less weight and less elaborate detail than those already mentioned. The heating stoves are represented, with the latest production, the Bright Crown, in the place of honor. This is a handsome parlor heater, made as a single and double heater and adapted for hard or soft coal. Various styles of the Crown heater are also shown, after which we find the Palace air tight heater, an all cast iron stove of an entirely new design this season; the Polaris cannon stoves, the Puritan sheet iron circulators, made as single and double heaters; the Waldorf sheet iron surface burners, the Wood oval stoves, the Franklinite, shown in several varieties, together with an assortment of Junior Globe stoves, Victor hot plates, caldrons, furnaces, &c. Accompanying the catalogue is a circular calling attention to the heating and ventilating of schools and churches by the March-Brownback system, using the apparatus manufactured by the company named.

The Charter Oak Stove & Range Company,

with offices and sample rooms at Main street and Cass avenue, St. Louis, Mo., refer to the Charter Oak hard coal base burner and the Charter Oak soft coal air tight surface burner as "two modern wonders." The great points in connection with these stoves are their heating capacity and economy in fuel. The merits of the goods, together with handsome illustrations, are presented in an attractive circular which has just been issued from the press. The Charter Oak base burner is made in three sizes, with fire pots 13, 14 and 15 inches, respectively, and is fitted with flues which are not only large, but are so constructed and arranged that the heat is kept to the outer surfaces of the stove and is easily and quickly thrown into the room. There are two cold air flues at the back of the stove, so placed between the hot air flues that they draw the cold air from the floor and discharge it from the top in a highly heated condition. The heat from these flues may be carried to an upper room if desired. In the case of the Charter Oak air tight surface burner for soft coal the fire pot and dome are heavy solid castings, surrounded by an ornamental open casing, making the stove, as the manufacturers put it, a small furnace. Accompanying the pamphlet is a four-page folder, which is in the nature of a supplement to Catalogue No. 1, bearing date of July 1, 1897. This illustrates and describes the Charter Oak air tight heater for soft coal, the Charter Oak hard coal base burner, and the Royal Oak, a new parlor stove for wood and coal.

Stove, Range and Furnace Repairs.

The catalogue of stove, range and furnace repairs, together with price-list of hollow ware, sinks, stove dealers' supplies, &c., issued by the Henry Clark Company, 103-105 Blackstone street, Boston, Mass., consists of 188 pages, profusely illustrated and bound in black paper covers with embossed side title in silver letters. In the opening pages instructions for ordering repairs are given, and in order to facilitate the work and reduce the liability of error to a minimum sectional views of stoves are given with the various parts numbered, the figures referring to a table containing the correct names by which the parts are known. Illustrations are also given showing the position of a full set of brick and of various styles of grates. The list of stoves for which repairs can be supplied covers a little over 60 pages, the names being arranged in alphabetical order and preceded by figures which indicate the number of pieces of brick in a set. Following the list of stoves is given a list of manufacturers, together with copious foot notes. By special arrangement with the Smith & Anthony Company, the Weir Stove Company, Century Stove Company, O. G. Thomas and the Highland Foundry Company, all repairs for their goods are made by them for the Henry N. Clark Company. The latter are therefore enabled to offer repairs from the original patterns for all stoves, ranges and furnaces made by these concerns. The remaining portion of the catalogue is given up to a varied line of hollow ware, miscellaneous goods, price-lists, &c., the work concluding with an index alphabetically arranged.

"Things Wise and Otherwise" is the title of a short treatise on heating and ventilating by F. E. Browne, who makes a specialty of Furnace Heating at 123 East Fourth street, Los Angeles, Cal. The book contains a half-tone engraving of Mr. Browne, followed by cuts of the Furnace made by him and some of its inner parts and his method of piping. Interspersed on pages between the cuts are comical pictures to illustrate points he makes for his Furnaces, and accompanying them are rhymes and other humorous matter which cannot fail to interest the buyer, as they bring forcibly to his notice the features of excellence which Mr. Browne claims for his Furnace. The last pages are devoted to a long list of people in Los Angeles and nearby cities in whose buildings he has installed heating systems.

ODD PLATES.

The Westchester County Fair for 1897, held at White Plains, N. Y., was well attended, and among the many things to admire was the display of Andes Stoves and Ranges made by Fowler & Sellers, White Plains. Among the Ranges shown were the Grand Andes, Royal Andes, Glen Andes, Lake Andes and New Grand, made by Phillips & Clark Stove Company, Geneva and Troy, N. Y.

"The Stove Repair Season Is Now at Hand," is the headline on a card in reference to Stove repairs received from J. Elwood Yeager, 56-58 North Second street, Philadelphia, Pa. The card also bears four pictures on the corners. One corner represents a dealer who does not get his Stove repairs promptly and at the proper prices, and below it is a picture of his office showing his order file nearly empty. On the opposite corner is a view of the dealer who buys at the right prices and gets his goods quickly. Below is a view in his office showing his order file filled with correspondence and an open order book written full of orders. It is needless to say that the balance of the card is devoted to the Stove Repair business, with a solicitation that orders be sent to the address given above.

Henry H. Gurnsey of New Haven, Conn., has the contract for setting 29 of the Royal Hot Air Furnaces, made by the Hart & Crouse Company, Utica, N. Y.

The Neenah Stove Works, Neenah, Wis., who had been running four days in the week, began running five days in the week last Monday.

The Lehigh Stove & Mfg. Company of Lehighton, Pa., are favoring their friends in the trade with buttons mounted on pins, and bearing upon their face the words "Lehigh Stoves." This is one of the many forms of advertising novelties which are being employed by stove manufacturers to keep constantly before the trade the names of their goods.

About January 1 a company will be formed and incorporated, with a capital of $50,000, to manufacture Stoves and other Castings in the plant formerly operated by the Perry Stove Company and later purchased by John E. Gaitley of the Troy Nickel Works, Albany, N. Y. The new concern will be known as the Albany Foundry Company, and a general jobbing department will be run in connection with the Stove end of it.

Graff & Co., Stove manufacturers, of Pittsburgh, Pa., will not remove their Stove plant from New Castle, Pa., to Remington, Pa., as reported. The concern were made an offer by a land company at Remington to remove there, but declined it.

The Peck-Williamson Heating & Ventilating Company, Cincinnati, Ohio, issue a large colored poster presenting a broken view of the Ideal Heater and Ventilator. The cut shows the Heater with pipe running through an upper story, with the warm air register and foul air duct and the chimney cap on top of the roof. By means of a broken view the construction of the Heater and the flues may be clearly understood.

The Ideal Foundry Company, Daleville, Ind., made their first heat on Wednesday evening, September 1. A local paper in speaking of the event states that although some of the fixtures were not in first-class order the heat was a complete success and everything now is moving along in the best of order. "Few factories," the paper states, "have ever started in the gas belt with brighter prospects before them. Orders are pouring in despite the lateness of the season, and there will be no trouble for this foundry to dispose of all the Stoves they are able to manufacture."

Last Saturday night a fire broke out in the foundry of the Detroit Furnace & Heater Company, Detroit, Mich., doing damage to the amount of several thousand dollars. The company, however, were only temporarily embarrassed, and they expected to resume business in a few days.

The Pittsburgh Reduction Company, New Kensington, Pa., are now drawing a Nickel Aluminum Wire, which is claimed to be much stronger than the Wire made from the pure metal. It is used for hair pins and for purposes in which an unusually stiff wire is required.

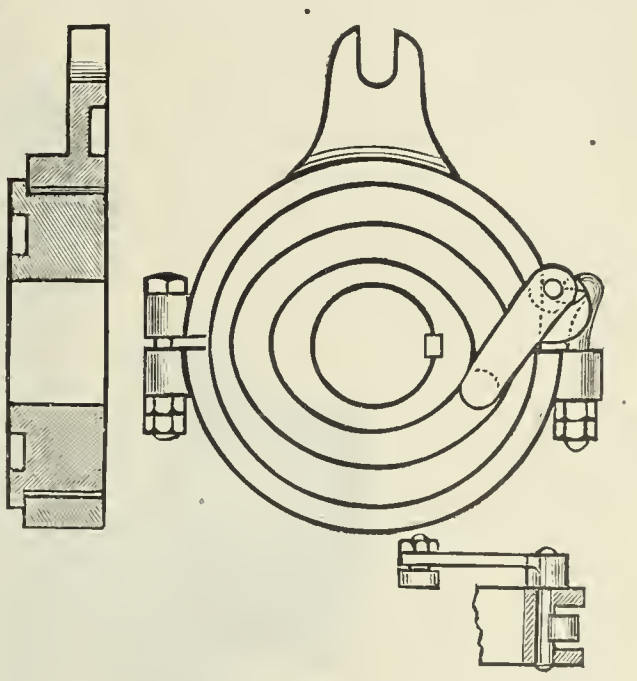
A dispatch from Berlin says that the German naval estimates to be presented by the Admiralty will be quite moderate. A programme drawn up by direction of the Emperor provides 50,000,000 marks for navy purposes for the coming year, and 60,000,000 marks for the next year's expenses.

Norman Whitelaw, who has been traveling salesman for the Richmond Stove Company, Norwich, Conn., for several years, has resigned to accept the position of contracting engineer with the H. R. Barker Mfg. Company of Lowell, Mass.

The Crosby Automatic Friction Brake.

A new automatic brake for power presses is herewith illustrated. It is intended to prevent the sudden reverse motion which would otherwise be communicated to the cross head when operating dies that are constructed with powerful steel or rubber springs under the lower die. Unless overcome or balanced in some manner the cross head, or slide, after being released from the pressure of the downward stroke would be driven up so forcibly as to probably break or derange the mechanism of the clutch, or by carrying it past the highest point before the clutch had caught on would allow it to descend again by its own weight, making accidents much more liable to occur.

The brake here illustrated acts automatically and only at the time required to prevent a sudden acceleration in the motion of the cross head, which is from the time that the punch and cross head start upward until the punch leaves the drawing ring, usually about one-quarter of a revolution of the shaft, thus leaving about three-quarters of the revolution of the shaft open or free from the friction or use of power. This device is manufactured by G.



The Crosby Automatic Friction Brake.

A. Crosby & Co., 176 and 178 South Clinton street, Chicago. It may be applied to any of their presses when desired, but is more particularly recommended for machines which are to operate large combination and drawing dies.

The Bureau of the International Postal Union at Berne, Switzerland, has published the annual report of the postal and telegraph business of the countries of the world for the past fiscal year. It contains an official statement of the receipts and expenditures of the various postal departments which is of interest. For the six leading countries these figures are as follows:

	No. of offices.	Receipts.	Expenses.
Germany	30,115	$97,360,000	$93 900,000
United States	69,912	79,775 000	89,940,000
G eat Britain	20,116	57 325,000	40 400,000
France	7,812	44,980,000	34,800,000
Russia	7,432	32,060,000	23,320,000
Austria-Hungary	9,859	32,740,000	31,040,000

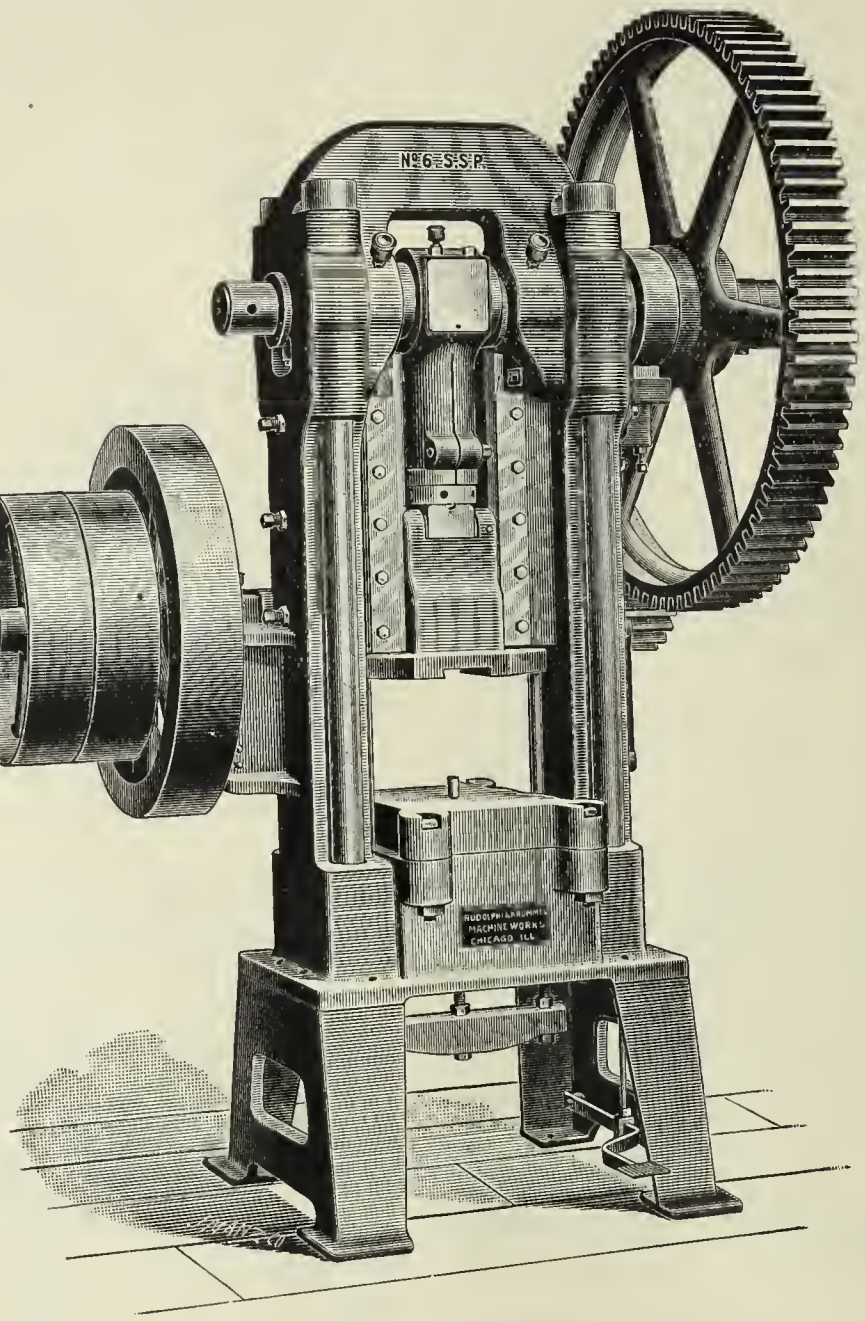
Among the smaller countries, the receipts of Italy were about $10,000,000, Japan $6,000,000, Switzerland $5,000,000, Spain less than $5,000,000, Belgium $4,000,000, the Netherlands $3,000,000 and Sweden and Norway a little less than $3,000,000. Every country, except the United States, is shown to derive a net revenue from its postal service.

About 8,500,000 workers in Great Britain are dealt with in the fourth annual report of the Labor Department of the British Board of Trade, just published, and covering the year 1896. Of these, the report indicates that only about 607,000 were affected in their wages. The general tendency in this respect was upward, 382,825 persons having had their wages raised and only 167,357 had theirs decreased, while there were temporary changes, up and down, in the case of 58,072 more. The net result of all the changes was an average rise of 21 cents a week. In the building trades the advance was 50 cents a week and in the metal, shipbuilding and engineering trades 27 cents a week. The hours of labor in 1896 were changed in the case of 108,271 individuals, the changes representing an average reduction of three-quarters of an hour's work a week for each person affected.

Rudolphi & Krummel's Straight Sided Press, with Tie Rods.

In *The Metal Worker* of June 5, 1897, an illustration and description were given of the regular straight sided line of presses manufactured by the Rudolphi & Krummel Machine Works, 96 to 100 North Clinton street, Chicago. A modification of these presses has now been brought out by the same makers, which is herewith illustrated. The modification consists principally in strengthening the presses with cold rolled steel tie rods. These rods are shrunk in the body casting in such a way as to place them under a predetermined strain proportionate to their section. It is well known that cast iron is not a very suitable metal for heavy tensile strains, particularly in castings of large sections, which are always more or less coarse grained and spongy in the center. The tie rods are, therefore, a desirable feature on presses intended for heavy work. The shafts of this style of presses, owing to their usually limited stroke, are generally made with an eccentric, as shown in the cut, thus affording an opportunity to support them closely up to the connection to avoid spring.

The clutch on these presses is provided with an additional set of locking pins, arranged in the gear or fly wheel. These pins serve to take up all backlash between the clutch pin proper and the gear, thus overcoming any rebound or shock experienced on the passing over of the lower center in doing heavy work. This new feature results both in a large saving of power, as the friction need not be set up tight, and also in a reduction of the wear in the different parts of the press. For setting the dies, these pins are pulled out and kept out by turning them a quarter of a turn, thus giving a sufficient amount of play, necessary for facilitating the setting. These presses are being built in six sizes, weighing up to 18,000 pounds.



Straight Sided Press, with Tie Rods.

Electricity and the Growth of Plants.

Experiments made lately by A. S. Kinney, an expert electrician, at the Massachusetts Agricultural College are reported to have demonstrated that electricity is a real incentive to the growth of plants. He submitted different seeds to the action of an electric current and found that germination was much accelerated. The experiments and their results are thus described: Two lots of 12 groups, containing 112 seeds each, were soaked in water until thoroughly moistened, and then placed while wet in glass cylinders, open at either end. Copper disks, which were connected to the two poles of an induction coil, were pressed against the seeds at each end of the cylinder and a current passed through them for two minutes. After this the seeds were sown, the temperature being kept at 45 to 50 degrees. The result was an increase of growth in the seeds to which electricity had been applied over the seeds not so subjected of 30 per cent. The results showed that electricity exerts an appreciable influence upon the germination of seeds ; that the application of certain strengths of current to seeds for short periods of time accelerates the process of germination. Seeds subjected to but one application of electricity show the effect only for a few hours, while electricity applied hourly to germinating seeds acts as a constant stimulation to their growth and development.

A copper pan, said to be the largest ever made from one piece of metal, has been turned out lately at Swansea, Wales. It is 12 feet 4 inches in diameter, 3 feet 3 inches deep, and weighs 2 tons.

An exceptional degree of activity is noted among the industries in the Indiana gas belt. More than half of the iron, glass and tin plate works are now running night and day.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Unusually heavy importations from primary points and from Europe have overshadowed other market conditions and forced wholesale prices down a fraction. The decline, however, was far short of what some observers (not dealers) have looked for, and the statement is warranted that the bulk of the importations were well taken care of in one way or another, although they have exceeded the estimated consumption for the month by several hundred tons. The current demand has fallen off somewhat, consumers and dealers being well stocked up by late liberal purchases. Retail prices are unchanged, small lots of Straits Pig from store selling at 14¾c. per lb.

Copper.—Export movement has continued on a scale that is surprising even to the most hopeful dealers, and a quiet business of very good volume has been effected with home consumers also. In short, the outward movement has kept well in pace with the heavy production and served to prevent any fall in values, despite very tame, bluish tinted reports from the speculative branch of the London market. In a small way the run of orders has been fair and prices firm, jobbers quoting Lake Ingot at 12¼c. per lb. and Ansonia Grade Casting at 11¼c.

Sheet Copper.—The general condition of the market for Manufactured Copper remains practically the same as for the past few weeks. Prices are firm in sympathy with the strength in raw material. The demand for Sheet Copper is little above the average for the season, and is curtailed to some extent locally by the strike in the cornice makers' trade. Nevertheless the aggregate of business for September seems to have compared favorably with that done in the same month of 1896, and the outlook for good trade is regarded as promising. Jobbers quote about 15c. per lb. basis on small lots of Sheet Copper from stock.

Pig Lead.—Operations have been moderate in this quarter, although reported large in the West, but the market has gained rather than lost in tone and wholesale prices are a trifle higher than a week ago. The consumptive demand in retail lines was very moderate and scarcely up to the average. Nevertheless jobbers' prices are firm at 4⅝c. to 4¾c. per lb. for American Pig in small lots from store.

St. Louis advices are as follows: The market for Pig Lead is quite active and some liberal purchases have been made. Sellers are looking for an early advance. They claim there are practically no stocks in the country, and that consumers have been buying from hand to mouth.

Spelter.—Firmness of more pronounced character has developed here, particularly in the instance of metal that consumers can work satisfactorily, and some increase in sales has taken place. Eastern consumers are still very conservative buyers, however, and the firmness of the market is due chiefly to more or less liberal purchases in other directions. Business in a retail way has been rather quiet, but prices show no change. For small lots of good Western Spelter 4¾c. to 4⅞c. per lb. is asked.

Advices from St. Louis are as follows: There is no change to note in this metal. Consumers are not disposed to anticipate their wants, appearing confident that an advance in Spelter is out of the question.

Antimony.—Sales have been fair and prices are steady at about 8¼c. to 8½c. for Cookson's, 7¾c. to 8c. for Hallett's, and 7¼c. to 7½c. for Japanese in small parcels.

Tin Plate.—The leading factor of the week in the Tin Plate market was the difficulty experienced by the mills in obtaining a sufficient supply of Steel Bars. This has obliged some of the mills to curtail their operations, notwithstanding that their order books are well filled. It has further increased the delay in deliveries to consumers and dealers on old contracts and made still more pronounced the difficulty the latter find in getting orders filled for spot goods. Most of the mills are away behind in their shipments, and the situation in this respect becomes more marked as time goes on. Were the demand for Tin Plates anything like as heavy as it was expected to be, there would be a famine in certain lines. As it is, the scarcity in 85, 90, 95, 100 lb. and full weight Cokes is causing no little inconvenience. These Plates, when they can be secured for spot delivery, are eagerly snapped up at a substantial premium. A quite large business has been effected during the week in American Cokes for more or less distant future deliveries at prices averaging from 2½c. to 5c. per box advance over the late ruling quotations. Spot goods and early deliveries command as high as 10c. to 12½c. advance Stocks of all kinds of Plates are extremely light, and the market, as a whole, seems shaping toward a higher level of prices all around. Jobbing business, as is usual at the close of the quarter, was rather light. The demand for Roofing Plates was especially disappointing. Quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs , $3.30 to $3.40; American Charcoal Brights, Melyn grade, IC, 14 x 20, $4.55; Allaway grade, IC, 14 x 20. $4 15; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates sell slowly, but being in light supply are held very firmly.

A special London cable dispatch of September 29, 1897, reports on the British Tin Plate market as follows : "Tin Plate for home trade quiet. Fair orders have come in for selected Cokes for Canada, and there is more demand from Russia, owing to the approaching close of the shipping season. Stocks at shipping point are returned as 55,000 boxes. We quote ordinary 14 x 20 Bessemer Cokes at 9s. 4½d. to 9s. 6d. at Swansea."

Sheet Iron.—The demand for Black Sheets direct from mills is very active. Manufacturers' books are filled with orders, and in many cases it is found impossible to obtain early deliveries. It has been a long time since the mills had as much tonnage booked as they have at present, and the outlook for steady operation for the winter is extremely encouraging. Prices continue very firm, and if demand continues and another advance in Steel takes place an advance in Sheets is probable. Galvanized Sheets are also moving very briskly, the aggregate volume of orders being larger than for a long time past. Locally, the demand has been cut short owing to the strike in the building trade. Prices are very firm for small lots here. No. 27 Common Black Sheets in small lots from store are quoted at about 2.40c. per lb. and Galvanized Sheets at 75 and 10 and 5 per cent. off.

Chicago advices are as follows : Occasional orders are being received for carload lots of Black Sheets, but the demand is not very large. The mills, however, are so full of work that carload business is falling into jobbers' hands. Galvanized Sheets are selling much more freely, the demand still coming from all classes of consumers. It is somewhat remarkable, in view of the heavy demand, that prices do not advance sharply. Small lots of No. 27 Black from stock are selling at 2.25c. to 2.30c. and Galvanized at 80 to 80 and 2½ per cent. off.

Old Metals.—The demand is increasing, and prices are strong with an upward tendency. Dealers here are pay ing about the following rates :

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¼c.
Light Brass	per lb. 4¼c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 2¾c.
Zinc	per lb. 2 c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.00 to $10 50
Heavy Cast Scrap, per gross ton	$9.00 to 9.50
Stove Plate Scrap, per gross ton	5.50
Burnt Iron, per gross ton	4.50

The St. Louis Aluminum Casting Company, St. Louis, Mo., have lately been organized to do general foundry work in aluminum under the patents of L. J. Crecelias. By the newly invented process it is claimed that absolutely sound, hard castings can be obtained, suitable for many purposes for which aluminum heretofore has been thought to be too soft a metal. The offices of the company are at 815 South Seventh street, St. Louis.

The gold production of the Witwatersrand mines of the Transvaal, in South Africa, shows a steady increase. During the first eight months of 1897 the total production was 1,890,513 ounces, as against 1,468,695 ounces for the same period of last year.

THE IRON MARKET.

The past week has been rather quieter in the Central West, but there are numerous indications that the tide is rising in the Eastern markets where the trade has been more conservative and has been inclined to wait until the pressure of distant competitors is clearly withdrawn.

The Pittsburgh market for Bessemer Pig has been rather quieter. It is reported, however, that a large Steel company who produce a very large quantity of Pig Iron have bought about 30,000 tons to cover a deficiency, and now comes the report of labor trouble at the plant of a large consumer in the Pittsburgh district.

Billets have been quiet, relatively, but are very firm, with a growing scarcity of Sheet Bars which is beginning to tell on the Tin Plate market. No very large transactions in Finished Iron and Steel have been closed during the week, but there is a heavy run of small orders in nearly all lines.

In Foundry Pig Iron there has been a lull, but the increasing strength of the market is shown by the fact that the Southern furnaces will not quote under $8 for No. 2 at Birmingham for 1898 delivery, and by the announcement that the Eastern Pig Iron Association has decided to hold to $10.50 for No. 2 Plain and $10.75 for No. 2 X at furnace.

Pig Iron.—The market in New York has been less active, but the undertone continues strong. The advances in the Southern markets are carrying the prices of that section, delivered here, closer to those which have been current for metal produced in Eastern Pennsylvania. The leading producers in the latter section have announced prices which are equivalent to $11.40 for No. 2 X, and $10.90 for No. 2 Plain. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.40 to $11.50; No. 2 Plain, $10.90 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

In the Philadelphia market the situation as regards Pig Iron seems to be growing stronger. The demand has been very large. Some holders have advanced their prices about 25c. per ton, but a still larger number have withdrawn from the market on the ground that they have all the business they ought to carry until things become more settled. It is also a noticeable feature that Irons which usually come to this market are now diverted toward the West, prices in that direction being more favorable than in the seaboard markets. It is difficult to quote a market of this kind, as prices paid within a few days past are no criterion of what may have to be paid to day or during the balance of the week. Sales were recently made at about $10.50 for No. 2 Plain and $10.75 for No. 2 X, but inside figures to-day would be 25c. advance, and in most cases 50c. advance would be quoted. The average range for seaboard deliveries, however, is about as follows, and 30c. to 50c. less at points within a radius of 100 miles south or west, according to freight rates: No. 1 X Foundry, $12 to $12.50; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75.

Business in local Iron in Chicago is somewhat better than during the past two weeks. The orders recently taken are estimated to have been fully up to the shipments made for the week. The demand for Southern Iron has, on the contrary, been rather light. The large companies are practically out of the market for the remainder of the year, but other Southern producers are in a position to take considerable business. Prices, however, are very firm and a further slight advance has been made on Nos. 2 and 3 Foundry and No. 2 Soft. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.00 to 12.00
Local Coke Foundry, No. 2	10.75 to 11.50
Local Coke Foundry, No. 3	10.25 to 10.50
Local Scotch, No. 1	11.00 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10 35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

As far as sales are concerned the market for Pig Iron in Pittsburgh has been quieter this week than last week, but prices are fully as strong and are higher. The more conservative element believe that prices are about high enough, and it would be much better if they could be held where they are. Foundry Irons are very firm. We quote as follows, f.o.b. Pittsburgh: No. 1 Foundry, $10.50 to $10.75; No. 2 Foundry, $10 to $10.25; No. 3, $9.50 to $9.75: Bessemer, $10.75 to $10.90.

Reports from the Cincinnati market indicate that the advance of last week was sufficient to check the buying movement so far as large transactions are concerned, but there has been a steady swell in the smaller trade which has been very gratifying. The volume of inquiry is still very good and a continuation of present conditions is expected for the next week or so at least. The buying has been good all along the line, the mills showing by their orders that their trade is looking up materially. Full prices have been obtained on most of the smaller sales, but on the whole prices have been rather irregular. The market closed strong with the indications that quotations will be more regular and better sustained. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled Forge	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The St. Louis Pig Iron market is quite active and a number of fair sized sales have been recorded during the past week. Furnaces are not disposed to take orders except for prompt shipment, and for deliveries later in the year are asking advanced prices. The scarcity in No. 1 Foundry continues and $10.50 to $10.75, f.o.b. cars St. Louis, is the ruling quotation to-day for this grade. An advance of 25c. per ton on all grades is expected before the middle of October. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $10.75
Southern, No. 2 Foundry	9.75 to 10.00
Southern, No. 3 Foundry	9.50 to 9.75
No. 1 Soft	10.50 to 10.75
No. 2 Soft	9.75 to 10.00

CHICAGO REPORT.

Scrap.—The market is becoming more active. Consumption is rapidly increasing. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$8.50	....
Machinery Cast	7.00	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	4.50	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.00	....
Old Boilers (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.50	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	10 c.
Copper Bottoms	....	9 c.
Copper Clips	....	9¾c.
Red Brass	....	8 c.
Yellow Brass	....	7¼c.
Light Brass	....	4¼c.
Pipe Lead	....	3¾c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	½c.

Anthracite.—The demand is not very large, the weather being too mild to influence business. The price on carload lots of 12 tons minimum is now as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7 60
Council Bluffs, Iowa	7.35	7 60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8 60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

The British Admiralty have recently placed an order with the Fairfield Shipbuilding & Engineering Company for the construction of a 30-knot torpedo boat destroyer.

THE HARDWARE TRADE.

The Hardware market presents few new features. The demand continues in about the same volume as for the past few weeks, but the current business has more of a distributive character, jobbers having pretty well covered their immediate requirements and being now well occupied in filling the orders of their customers. There is thus a slight falling off in the demand upon manufacturers except in a few lines, principally in the way of Heavy Hardware where special conditions encourage continued and more liberal buying. In prices there is little new to report. The market is steady, and in a few lines there is a perceptible tendency toward somewhat higher prices. In a good many kinds of goods there is a withdrawing of extreme discounts, while it is not feasible to make any actual advances. The most encouraging features which have characterized the business situation still continue, and there is a decidedly hopeful feeling prevalent among the trade in all parts of the country. The good prices ruling for farm products are putting the agri cultural classes in excellent condition. and the trade is beginning to feel the influence of their increasing prosperity. There is little doubt that this improvement in trade will continue, while the full effect of it will not be manifested until after the opening of the new year.

Advices from Chicago.—A healthy trade is in progress in Shelf Hardware. The volume of business keeps well up to the average of the past few weeks. The character of the trade is of course changing with the advance of the season, but while the demand for some articles has fallen off, a better movement in others is fully supplying the gap. Staple goods are going out very freely, advances in price having stimulated buying even of such articles as may not be in immediate demand by consumers. Many buyers are of the opinion that the trade is now in for a long upward movement, and that it is a good time to lay in stocks on which nice profits may later be realized. The movement of Tinware is not quite so vigorous as earlier in the month. Jobbers, however, look for a revival of the demand before the middle of October. It is expected that by that time the advent of cooler weather will cause a brisk demand for Elbows, Stove Pipes and other Sheet Metal seasonable goods. Tin Plate is still scarce and hard to get, especially for early delivery. Jobbers have had a demand during the past week for Black Sheets from stock, needed by large consumers who were unable to secure prompt shipments from the mills. Manufacturers of all kinds of Hardware are behind in shipments as much as ever, showing that the demand for their products is very great from all localities. Heavy Hardware jobbers report their trade of the most satisfactory character. Iron and Steel and Wagon and Carriage stock are all moving very freely, the consumption being in this immediate vicinity as well as throughout the country tributary to Chicago.

Advices from St. Louis—The Hardware jobbing trade continues in the active condition last noted, and the improvement gives promise of continuing for the balance of the year. The only drawback to the situation is the presence of yellow fever in the South, which continues to curtail business from that section quite considerably. The demand from other sections, however, is very heavy, so that the total business foots up a satisfactory volume. Prices are firm and advances are recorded from day to day. The recent advance in Carriage and Machine Bolts and Lag Screws is being well maintained, although the same cannot be said of Barb Wire, which is in some cases shaded. Wire Nails and plain Wire, however, are very firm, and present indications point to higher prices for these commodities. Builders' Hardware is being ordered quite freely, and in the way of Metals Black Sheets and Galvanized Iron are particularly active, and prices are quite firm. The Heavy Hardware trade is active and the demand from wagon manufacturers is heavier than it has been for many months.

NOTES ON PRICES.

Wire Nails.—During the past week there has been a continuance of the active business in Wire Nails. Trade is unquestionably stimulated by the fact that stocks throughout the country have been small and by the improved tone of the market. Most of the mills are fully supplied with orders and are refusing to accept orders for future delivery at present prices. There has been but little change in the tone of the market, though the tendency is toward slightly higher prices. New York quotations are as before, $1.65 for small lots from store.

Advices from Chicago.—Manufacturers report fair inquiries, but not much buying being done at present. It is likely that most of the large distributers of Nails have covered their wants for the next 60 days, and therefore feel complacent at the advances recently made by manufacturers. The factories, on the other hand, are well supplied with work, some of them refusing to quote even for December delivery, so that the trade is probably well balanced and in good condition. Jobbers quote $1.60 to $1.65 for small lots from stock. The movement from jobbers' stocks is quite active.

Advices from St. Louis.—The demand for Wire Nails is not particularly heavy, although it is likely to pick up at any moment. Jobbers ask $1.65, base, for small lots from store.

Cut Nails.—In sympathy with Wire Nails the Cut Nail market has a firm tone, and while business is not heavy there is a perceptible improvement in the demand. Prices have advanced about 10 cents, small lots from store in New York being quoted at $1.53.

Advices from Chicago.—The demand for Cut Nails is very light as compared with the movement of Wire Nails. The volume of business, however, is about the same from week to week. Small lots from stock are selling at $1.45.

Advices from St. Louis.—The market is in excellent condition, and while the demand is not particularly heavy prices are being maintained without any difficulty.

Barb Wire.—There has been little change in the Barb Wire market during the past week. Its tone continues firm, and a good volume of business is reported. Quotations of last week still hold.

Advices from Chicago.—Jobbers are pleased to find a steady demand from their customers, who are evidently of the opinion that it is a good time to lay in a stock of Barb Wire for the future, even if their customers may not need it immediately. They quote small lots from stock at $1.65 for Painted and $1.95 for Galvanized.

Advices from St. Louis.—The Barb Wire market continues in the satisfactory condition last noted.

Smooth Wire.—There is little change in the Smooth Wire market. There is a good demand for Nos. 14 and 15, while the other sizes are quiet. Prices are unchanged.

Glass.—The conditions prevailing a week ago have in no wise changed. The Glass workers seem no nearer a settlement of their difficulties than then, while the manufacturers are making the most of the time and situation to perfect a reorganization of the Window Glass agencies. New York jobbers' prices for American Window Glass are 60 and 10 and 5 per cent. discount. The French Glass Association, under date September 30, issue a new price-list on imported Glass, as herewith given, which is subject to a discount of 85 per cent.:

French Window and Picture Glass.

	Single.				Double.		
	1	2	3	4	1	2	3
Sizes.	$	$	$	$	$	$	$

36 x 60 to 40 x 60..	47.50	44.25	42.00	.....	64.50	60.50	57.50

White Lead.—Dry White Lead has met with merely ordinary sale, but with the market for crude material in unusually good shape prices have been held very steady by producers generally. Lower prices on Oil have acted as a stimulant to competition among grinders of Lead in Oil, however, and while list prices generally have undergone no change, it is an open secret that concessions of one kind or another have been made to secure desirable orders, not only in the West but in territory nearer to this city. Foreign makes sell at fancy prices, but in retail way only.

Red Lead.—Red Lead has met with merely fair sale, chiefly at old prices, and the market is not perceptibly affected by reported advices of higher quotations from the foreign market.

Linseed Oil.—Cheaper seed and sharper competition between New York City and out of town crushers have served to bring about some demoralization in values, and the market at this writing is decidedly weak.

Spirits Turpentine.—Prices have continued to move steadily upward and are strong at 35 cents for retail lots. The advance was due mostly to higher quotations at the South, but had some support in fairly good purchases here.

Old Rubber.—A moderate business is noted in this department. Local dealers are paying about the following rates:

Car Springs, ton lots, per lb .....3½c.
Rubber Shoes, carloads, delivered at factory, per lb.....4.17c.
Rubber Shoes, less than carloads, per lb.....4c.
White Wringer Rolls, per lb.....4c.
White Syringes, per lb..... .4c.

Old Rags, Paper, &c.—The market for these materials shows considerable strength and activity. Prices are very firm for most lines of Paper Stock. The following are about the rates paid by New York City dealers:

No. 1 White Rags	per lb.	2¾ to 3 c.
No. 2 White Rags	per lb.	1¾ to 2¼c.
Mixed Rags	per lb.	¾c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1⅛c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 3/5c.
No. 1 Manila Paper	per lb.	¾ to 9/10c.
No. 2 Manila Paper	per lb.	½ to ⅝c.
Bogus Paper	per lb.	½c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1¼ to 1½c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅝ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Non-Rustable Soldering Fluid.

The following is recommended by J. W. Innes in the *Indian Textile Journal* as a good soldering fluid, free from rusting properties: Take 4 pounds of muriatic acid (spirit of salts), pour it into a vessel that will stand a good heat—one made of fire proof earthenware is a suitable one. Now add about 4 pounds of ordinary zinc cuttings; if old zinc is used a rather larger quantity will be required. It is best to add the zinc in two or three lots. The acid will dissolve the zinc. When it refuses to dissolve any more zinc, it is then known as being thoroughly killed. Let the liquid cool; then add a small quantity of red oxide to color. The next proceeding is to filter. This is an easy matter. Simply pour the liquid through ordinary muslin. Having filtered, add 1 pound of strong liquid ammonia, stir, and then bottle. This preparation can be used as a soldering fluid, and, it is claimed, will not cause rust to appear on the articles on which it is used. The vessel in which the fluid is prepared must be large enough to hold quite 8 pounds, so that when the effervescence takes place the acid cannot overflow.

A very convenient arrangement, which has been introduced lately in a number of railway stations in Germany, might be adopted with advantage in this country. Passengers for suburban stations, instead of going to the regular ticket office and standing in line for several minutes, sometimes so long that they miss their train, can go to an automatic box and by dropping a nickel in the slot or a coin equivalent to the amount of the fare can supply themselves with a ticket in an instant. There are rows of these boxes erected against the wall in convenient locations. The name of the town is painted in large letters, and underneath the price of the ticket. Platform tickets, for the convenience of those who wish to accompany their friends to the train, are issued in the same way.

The returns of the foreign trade of Italy for the first half of the current year show that the imports remained nearly stationary, being $115,935,000, against $115,065,000 in the first half of 1896, while the exports declined in the same period from $110,822,000 to $98,968,500.

The Japan *Mail* states that the Japanese Railroad Company of Tokio, who operate the largest railway line in the Japanese Empire, have decided to expend about $13,000,000 during the next six years in extending their lines and increasing the equipment. The improvements include the double tracking of an important line 140 miles long. The company's rolling stock will, it is said, be increased to 500 locomotives and 1600 passenger and 5200 freight cars.

Progress is being made with the preparations for the Pan-American Exposition, to be held on the Niagara frontier, near the Falls, in 1899. A picturesque and desirable site for the exhibition has been secured at La Salle, on the frontier, where a tract of about 300 acres, accessible by rail, trolley and steamer from Buffalo and Niagara Falls, is being prepared. Plans for the grounds and buildings are now in course of completion, and it is stated by the management that the whole enterprise will be carried out on a liberal and extensive basis, fittingly marking the close of a century of remarkable progress in the Western Hemisphere.

The books of the Merchants' Association of New York show that over 1800 merchants have visited the city within the past six weeks as a result of the special inducements offered by the railroads in the shape of buyers' excursions.

The United States Consul at Ghent, Belgium, reports to the State Department that the Belgian Government has exempted from building, paving and sewerage taxes all houses erected by workmen for their own use or by building associations for the occupation of workmen.

The Japanese Government is reported to have placed orders for one large and eight small torpedo boats with the Schichau Company of Elbing, Germany. The large boat is to have a speed of 28 knots and the smaller ones 25 knots.

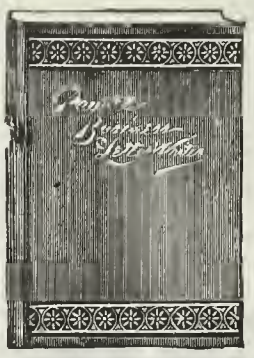
PAYNE'S BUSINESS AND SOCIAL LETTER WRITER

Containing Commercial Forms and Specimen Letters on Business and Social Topics with Appropriate Answers.



This is not the only *Letter-Writer* published, but it is the only one we know of that contains model letters for all the occasions of Social life and of Business life. The specimens given are really models in every respect—in address, in phraseology, and signature, as well as in the use of capitals and punctuation marks. There are letters of favor; letters of introduction, congratulation, and advice; invitations, acceptances, regrets, and excuses; letters to accompany presents—in short, letters of all sorts to all sorts of people. Follow these models and you cannot go wrong. More than this, the book gives rules for spelling and punctuation, the postal laws, a dictionary of abbreviations, and the Latin, French, Spanish, and Italian words and phrases that may be used effectively by writers in English.

Containing 350 Pages, 12mo, Cloth. Price, $1.00, postpaid.

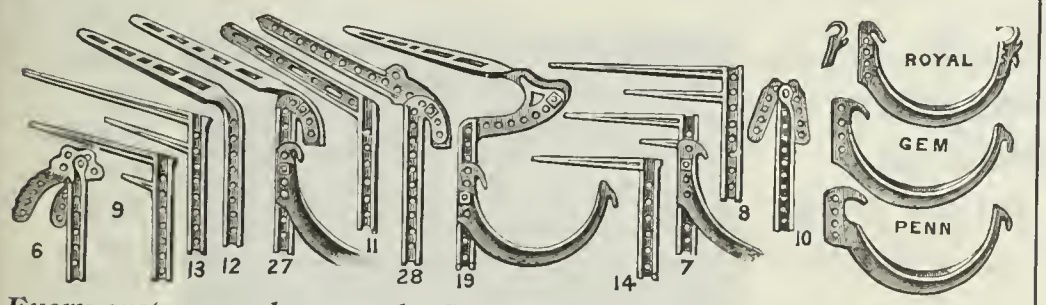
Berger's Gutter Hangers.

Tinners can find among our complete line a style of hanger to suit any kind of roof; it only requires the proper selection. Attention is called to the *HINGED SHANKS*, made for any pitch roof. All are strong and easy to put up, leave a free open gutter, and are neat in appearance. No. 34 is specially made to hang gutter to corrugated iron roofs and awnings. Send for our **HANGER CIRCULAR,** which clearly illustrates them all.



Every customer who uses the Gem Circle should ask for a free sample of the new Royal Circle with next shipment.

B. B. Pipe Fasteners are so simple, so good and so cheap that there is no excuse for using a poor one. We will convince you if you will write for a free sample.

Length of drive and whether for wood or brick should be stated.

Berger's Pat. Standing Seam and Slate Roof Snow Shoe Irons are a great success, and you should not buy any other before examining them. A good article at reasonable price.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Annunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.
Chapter IX.—Running Wires in Finished Buildings.

PRACTICAL HINTS

— ON —

JOINT WIPING,

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

BICYCLE REPAIRING

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, $1.00.

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII.—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending,
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work —Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

BLUE ANNEALED, STOVE PIPE SHEETS

We are one of the very few (if not the only ones) who adhere to the method of hand-dipping all our galvanized sheets; where this was the rule it is now the exception. The present method of other producers reduces the volume of coating to a minimum. Our sheets are soft, and the coating is unusually heavy and adherent, commending it especially to Cornice Makers and all workers of Gal. Iron. Write for quotations.

are prepared to make lowest prices consistent with quality of product; carrying a large stock on hand at all times, can make prompt shipments. Sheets are uniform, sheared true to size and regular to gauge, free from splits and holes. Try a sample lot.

—A VISITOR in Pass Christian, Miss., the other day heard some pistol-shots, and asked a negro boy what they meant. "Oh," was the reply, "them fellows dun be shootin' fo' hats." "Shooting for hats!" exclaimed the visitor, "what on earth do you mean?" "Sure, dere is nuffin' strange 'bout dat; they's doin' it ebry day, 'most. When de train is comin' day jes' fires dem shots when she gets good on de bridge, an' de men day sticks dere heads out to see what's up, an' de wind jes' takes dere hats off an' drops 'em in de bay. Den dey rows around an picks 'em up. Sometimes dey gets a lot of 'em. Other day Josh Johnson got seben." "What does Josh Johnson do besides shoot for hats?" was asked. "Oh, he fishes an' does odd jobs an' lives."—*N. Y. Tribune.*

—CURIOUS NATIONAL CUSTOM.—"I was so mad," said the vivacious young American lady, "that I could have eaten a pound of nails."

The listening Englishman made a note in his commonplace book that evening: "Anger is so well recognized as a nervous complaint in this country that the natives are in the habit of taking iron to counteract it."—*Cincinnati Enquirer.*

—HE GOT IT.—A well-known speaker was recently holding forth at an open-air meeting at a place not far distant from Oldham.

"Fellow-men!" he shouted, "what we workingmen want and what we are going to get is free land! We want the land for the people! Free land, fellow-slaves, we want, and we are going to have it!"

Precisely at that moment a large piece of earth landed in the speaker's mouth, and while he was clearing it away a voice yelled out:

"Neaw, then, tha's a getten a bit o' Lankesheer to begin wi'!"—*Answers.*

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

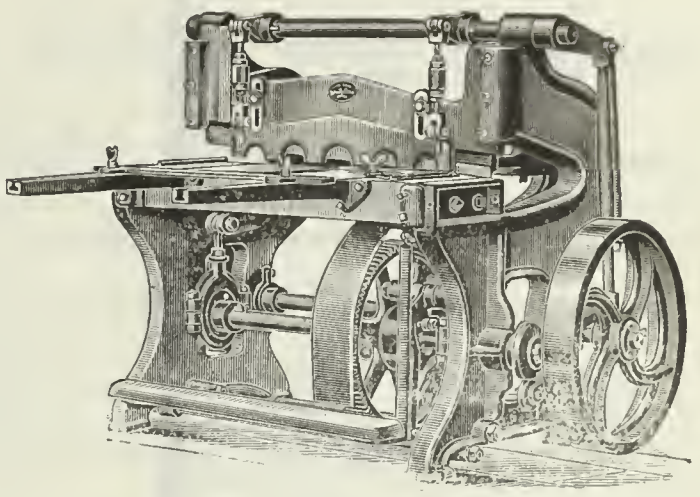
Niagara Gap Shears.

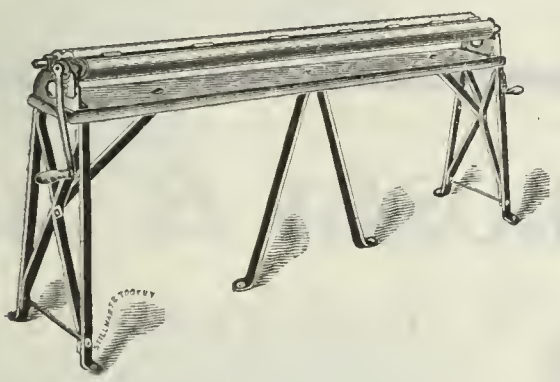


For Belt Power.

Capacities, 1-16 to 1-4 inch iron and lighter. Lengths, 30 inches to 10 feet.

The housings of these shears have a gap or open throat 15 inches deep. In addition to cutting and squaring sheets of sizes given below, sheets of unlimited lengths can be trimmed and split 15 inches from the edge or less.

The CAPITAL GUTTER FORMER



is adapted to form gutter from 3 inches to 7 inches inclusive. The forming of the bead and gutter is practically a continuous operation. Capacity 600 feet perfectly formed gutter per hour with two ordinary men or boys.

The Rotary Slitting Shears

are provided with two or more pair of cutters which are easily adjusted to cut a sheet of metal 30 inches wide into as many strips as may be desired, from ⅛-inch and wider; is simple and durable, and will be found to be a very useful tool for slitting sheet metal for any purpose where long lengths are required.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

EXCELSIOR STRAIGHT-WAY BACK PRESSURE VALVE

This valve has no dash pots, springs, guides or complicated levers to get out of order. It is simple, reliable and well made. Never sticks, and can be relied upon at all times when using exhaust steam for heating; or when used as a relief, or free exhaust on a condensing plant, it has no equal. It is noiseless and free from any complicated attachments.

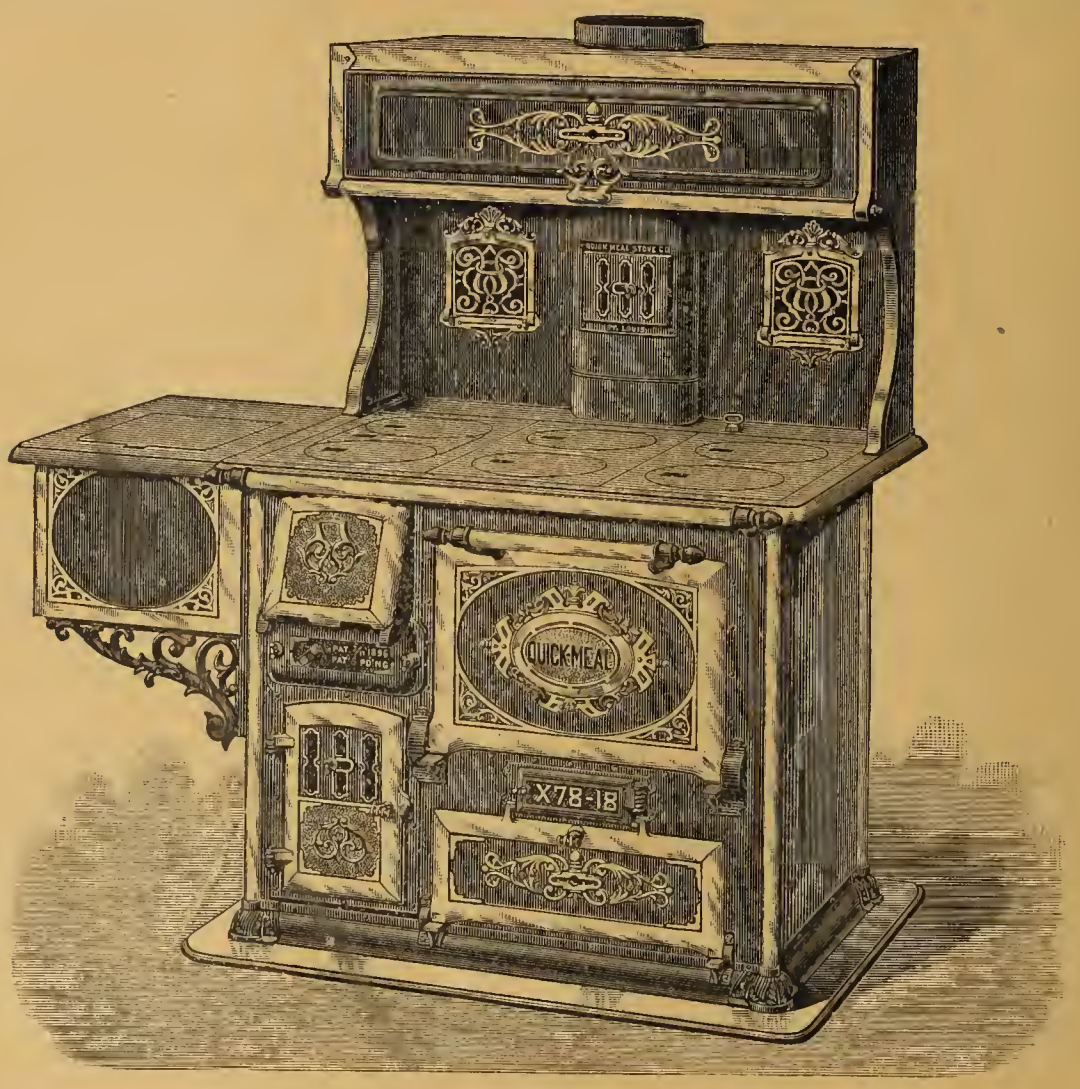
"QUICK MEAL"

STEEL RANGES

ARE EASY TO SELL



BECAUSE the points of superiority over other Ranges are so many and so marked that customers can be made to see them at once. No brain-racking is necessary to find talking points for "Quick Meals." Then the name is one that is known everywhere and is a recommendation in itself. The prices, too, are such as to help make them easy sellers. No customer can "stump" you on a single point of construction. We have taken care of that. They are also the finest appearing Ranges on the market. The ornamentation is rich and tasteful. There is just enough of it; neither too much nor too little. These facts are proven by the way "Quick Meals" are selling. There are no signs of dullness in the Steel Range department of the "Quick Meal" factory. We are running full and selling all we make. Handle "Quick Meal" Steel Ranges and you will be busy, too.

THE FORBES WARM AIR FURNACE.

PHILADELPHIA, April 10, 1897.

Messrs. TUBULAR HEATING AND VENTILATING CO., 228 Quarry Street, Philadelphia.

GENTLEMEN:—The Forbes Warm-air Furnace placed in my house last fall has given me entire satisfaction.

During the greater part of the winter the house had to be kept at a very high temperature, owing to illness in the family. Your furnace did all it was called upon to do, and ou a remarkably small amount of coal.

Last winter a furuace of a popular make failed to even warm the house comfortably, and burned fully 50% more coal.

I think your furnace is all you claim for it, and do not hesitate to recommend it to any one desiring comfort and economy. Very truly,

5027 Florence Avenue. M. J. FALLS.

PROGRESSIVE GOODS FOR PROGRESSIVE DEALERS.

We want to tell you all about this line, its prominent features, its great superiority and ***its low prices.*** A postal request from you will bring you a little book which will do our talking.

THE MT. PENN STOVE WKS., Reading, Pa.

PHILADELPHIA STORE, 111-113 N. 2nd STREET.

AN AGE OF PROGRESS

Which is aptly illustrated in our line of Heating Devices. This is especially true in our White and Blue Flame Oil Radiators, which are so constructed that each burner can be used independently, thus regulating the temperature of the room as desired, and are absolutely odorless, as well as more economical than any other style of heating stove, and more convenient and ornamental. We have added to our line of White Flame Radiators the Blue Flame, which after a most thorough trial we do not hesitate to recommend to the public. For economy of fuel it has advantages over other styles of oil burners, as the Blue Flame makes a more intense heat.

We also call attention to our Cylinder Oil Heating Stove, which for durability, simplicity and quick lighting and the price must become one of the most popular heating stoves on the market.

In addition to our line of White and Blue Flame Oil Heaters, we make a line of eighteen different styles of Gas Radiators and Heaters; we also make twenty different styles and finishes of Gas Mantel Grates.

We are confident it will be in the interest of all who deal in this line of heating devices to inform themselves thoroughly of our line before making their arrangements for the coming season.

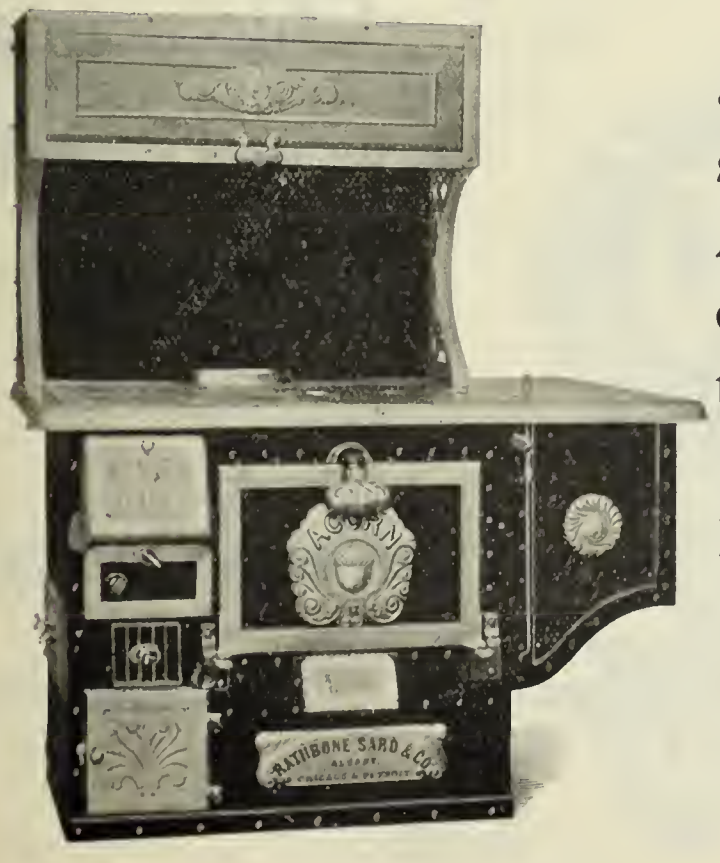
The Active Acorn.

A Specialty Without an Equal.

Thousands of these ranges have been sold since its introduction this spring. At times it has been difficult to fill orders, so great was the demand.

We claim for the Active Acorn that it is a sure and quick worker; more durable than any cheap steel range. Is easily repaired when necessary. Has a great number of selling features. Will not get broken or damaged in shipment, and is the handsomest and quickest selling range ever made.

Remember, the Active Acorn is not a steel range. It is made of heavy cast plates, with a steel oven. It resembles steel ranges in its shape only.



Prices are about the same as are charged for common sheet iron ranges, and the Active Acorn will outlast three or four of these inferior patterns.

If you don't sell it you are losing valuable trade.

Maple Clermonts.

There is no better stove in the market than this. That is what those who have ordered sample stoves say, and they order again a greater number.

We know they are right, because we have done honest work on this stove.

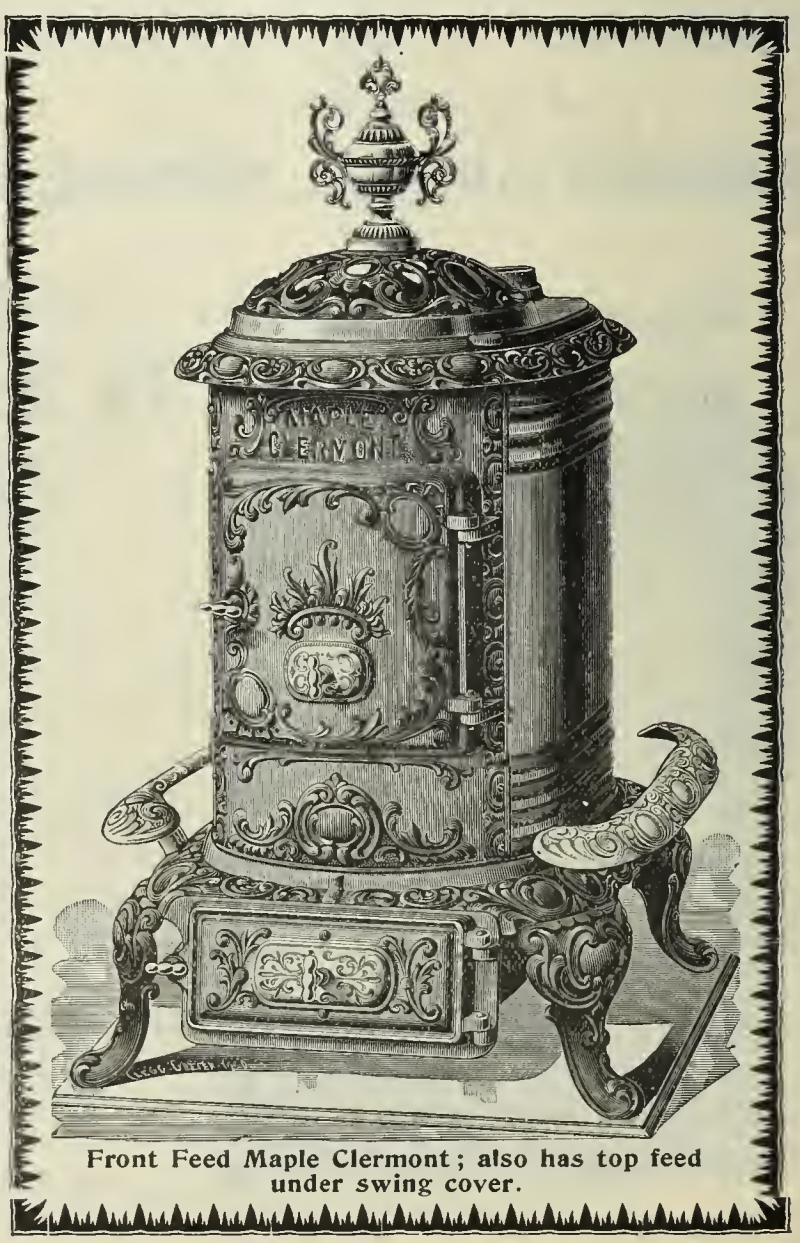
LARGE ASH PANS. Ground doors and screw registers. Strictly air tight. Perfect fire-keepers. Shaking draw-center wood grates. Large convenient top feed. Large door feed with smoke guard. Heavy cast lining all around, extending above fire limits. Cast tops and bottoms. Extra heavy polished steel bodies corrugated to prevent buckling. Screw draft registers. Nickel foot rails, name plates and panels. Ornamental swing cover and spun urn.

These are by far the finest, handsomest and best built stoves in the market, and they are amply protected by patents.

Both styles made in four sizes—18, 22, 24 and 28.

THE GEM CITY STOVE CO.,

DAYTON, OHIO.

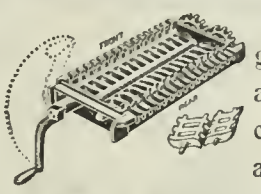


Front Feed Maple Clermont; also has top feed under swing cover.

MAGEE "GRAND" MAGEE

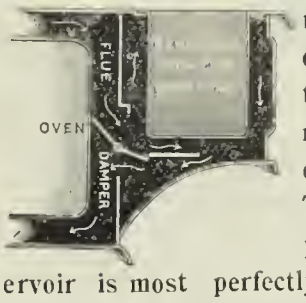
Showing Range with Cabinet Base and Tea Shelf.

Write us about it.



It is the ONLY grate by which a continuous fire can be kept for an indefinite time without impairing the baking qualities of the range.

By removing plate (as shown) **the Grate can be drawn out** without disturbing the linings. **Reservoir** can be removed from or attached to Range by removing end jamb. The "Magee patent" reservoir is most perfectly arranged. [See cut.] The water can be heated **very quickly** and **perfect operation** of the Oven maintained.



Made in all the usual Sizes and Styles, 7-18, 8-18, 8-20 and 9-20.

"There is pleasure as well as profit in selling this range."

Monarch Blue Gas Flame Oil Heating Stove.

The phenomenal success of the "Blue Flame" Oil Burner of the past two years has created a "Macedonian Call" for a heater made on the same lines, and the "Monarch" steps forward to supply the demand. It has been on the market one year, and for the season of 1897-8 is presented with several important improvements which a year's experience has suggested and we offer it with all confidence in its efficiency, cleanliness, intense power and great comfort.

There are no others with Blue Flame.

Top tilts back to light the Burner or to remove the Tank. Mounted on Casters. The entire Stove is richly nickeled and beautifully polished. Brass Tank. Burner cannot creep up. Will not smoke or smell. There is only one "Blue Flame" Heater and that is the "Monarch."

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

ARE DURABLE.

Office of
E. D. F. Brady,
Attorney at-Law.

Washington, D. C., June 8, 1897.

Superior Foundry Co.,
Little Falls, N. Y.

Dear Sirs:—I take pleasure in stating that the "Superior" Hot Air Furnace which I had put up in my residence in Garrett Park, in 1891, has given in every respect. the fullest satisfaction.

For heating capacity, durability, and economy of consumption of fuel, I think from my experience I can state your furnace has no superior. It has been in constant use every winter from October, 1891, has done its work most satisfactorily, and no part of it has broken or been burnt out. Since you placed it in position I have not been under one cent's cost for breakage or repairs of any nature.

I will add that many friends of mine, who, upon my recommendation. have had your furnaces put in their dwellings, have spoken of them in the highest terms.

Yours truly,
E. D. F. Brady.

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.

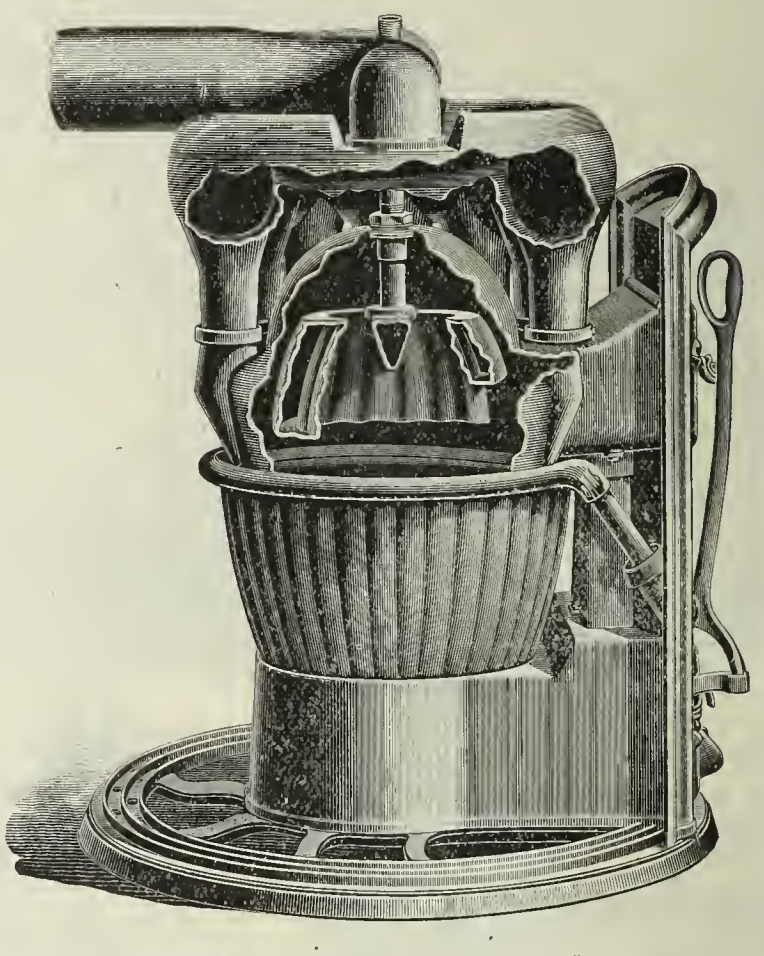
STAMFORD
COMBINATION HEATER
HOT AIR AND HOT WATER



300 SERIES WITH GAS-FLAME FLUE

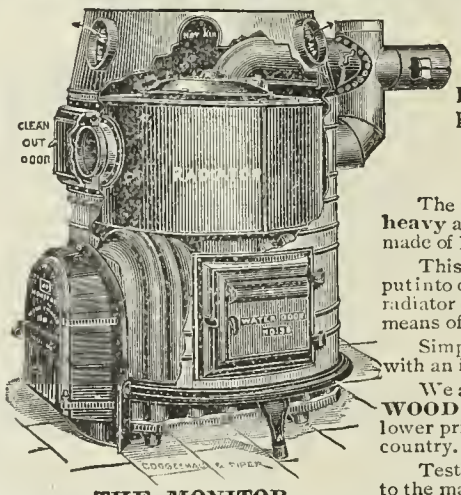
In the above cut the castings are broken away to show the position and shape of the water-heating section.

The water section is made in three sizes, and large or small water section can be used in same size of furnace.

Stamford Foundry Company

STAMFORD CONNECTICUT

WOOD FURNACES



THE MONITOR.

ESTABLISHED 1839.
INCORPORATED 1894.

OUR IMPROVED MONITOR.

With DIRECT and INDIRECT DRAFT, is made in two sizes for Brick or Galvanized Cases.

No. 38 burns 3 ft. wood, No. 50 burns 4 ft. wood.

The fire-box is made of cast iron, **corrugated very heavy** and **substantial.** The dome and radiator are made of **heavy plate** iron (gas tight).

This furnace can be set in low cellars and is easily put into old brick work. With smoke pipe removed, radiator can be cleaned thoroughly in five minutes, by means of clean-out door in front.

Simple to manage and most economical in fuel, with an immense heating power.

We also make the **CLIMAX and HOT BLAST WOOD FURNACES,** the best of their kinds at a lower price. Thousands in use in all sections of the country.

Testimonials and full particulars sent on application to the manufacturers.

WOOD & BISHOP CO., Bangor, Me.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importanco in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

---

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

—THE ONLY KIND.—Irate Citizen (to scorcher)—"Hi, there, have pedestrians no right in this city?" Scorcher (whizzing by)—"Certainly they have—funeral rites."—*Brooklyn Life.*

—PARTICULARLY HONEST.—An Oakland bootblack, an honest man who would not deceive his patrons, when he first went into business, six years ago, put up a sign which read: "Joe Garibaldi, bootblack. Has two small children" Each succeeding year found him deserving of more sympathy, for he kept amending the sign until it read, eight small children. A few days ago Joe's stand was locked for a whole day, aud when he returned the next morning he coufided to the butcher's boy that his baby had died. His first work was to amend the sign so that it might uot mislead the public, and it then read: "Joe Garibaldi, bootblack. Has seven small children." Then, to avoid being placed in a false position before the public, he added with his finger and shoe blacking: "One he die."—*Argonaut.*

DIRECTIONS FOR USING.

Place the arms 3 in flue hole, leaving lugs 5 and ring 1 close to outside surface of chimney, insert stovepipe as usual. As stovepipe enters flue hole, lug 5a catches on inner surface of chimney. Turn thumbnut 8 until ring 1 is tight around pipe. Push collar to accustomed place and the entire lock is out of sight.

Packed, 1 doz. in nicely labeled box.

Send in your orders at once. Set the pace rather than follow the other fellow. The cost is but a trifle.

No more cussing on account of stovepipe.

—"Did you tell papa how tender your love is for me, darling?"

"I did, sweetheart, but he gave me the laugh and said that it was legal tender he wanted to see before we could do business."—*Detroit Free Press.*

—A characteristic story is told of a New England man and his wife who live very methodically. One evening at exactly 9 o'clock they went to the kitchen to make the final preparations for the night. "Marthy," said the husband, after a few minutes, "hev ye wiped the sink dry yit?"

"Yes, Josiah," she replied; "why do you ask?"

"Well," he answered, "I did want a drink, but I guess I'll git along till the morning."—*New York Tribune.*

—Interesting to Parts-Makers.—A locomotive contains two hundred and forty main parts, a watch two hundred and thirty, and the human body two hundred and eight parts—that is, bones. These three constitute a trinity of power, delicacy and elasticity, and each of these qualities is represented in the one hundred steel parts of a bicycle. And as a chain is no stronger than its weakest link, so is a bicycle no stronger than its weakest part.—*The Wheel.*

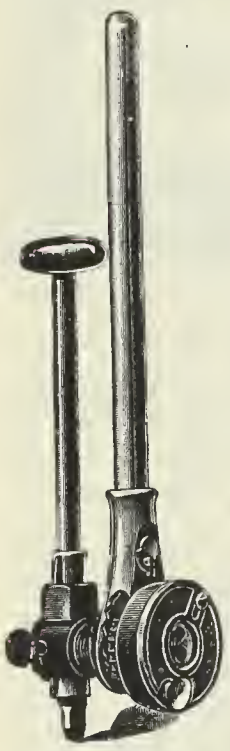
NEW YORK. BOSTON.

The Climax Ratchet Stock.



is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

—A SMALL number of women have served as letter-carriers in England for many years, and they give general satisfaction. Only a few months ago a noted old postwoman died at Cutsyke, some ten miles from Leeds. From the Queen's accession, in 1837, till 1869 she was the letter-carrier in the ancient town of Pontefract, and was never known to be absent from her duties from sickness during the thirty-two years. Monckton Milnes, first Lord Houghton, took an interest in her career, and was instrumental in obtaining a Government pension for her in her declining years—*New York Tribune.*

—"Do you plead guilty?" asked the Judge as the trembling wheelman was brought to the bar by the relentless cycle cop.

"No, sir," answered the victim, "I was not riding faster than ten miles an hour."

"Your Honor," exclaimed the officer, "he was going twenty miles an hour."

"That is impossible," replied the prisoner. "I was merely keeping up with a trolley-car, and Your Honor knows that if it had been going faster than nine miles an hour these efficient policemen would at once have arrested the motorman."—*Buffalo Express.*

—HE EVIDENTLY was from the rural districts, and therefore his uneasiness upon what presumably was his first visit to a photographer could easily be overlooked. At last, when he was summoned to the operating-room, and caught a whiff of chemicals from the "dark room," he hesitated on the threshold, half-suspiciously. "Come in; come right in," said the camera man reassuringly. "Do you want a vignette?" "N-no, I guess not," replied the old man. "I guess I can stand it without taking anything." "Would you like a photograph of your head only? Or would you prefer one-half length or full length?" inquired the photographer. "Well, now, I'll tell you how it is, mister," remarked the old granger, confidently. "This picter is for a widder in Nebraska who's been writin' to me considerably about gettin' spliced. I reckon she'd ruther have a picter of my whole system if it don't make any difference to you." It didn't.—*Chicago Times-Herald.*

—"YESSUH," said the proud Vine street father, "it weighs ten and a haf pouns, an' it's as fine, healthy a boy as evah yah see, an' it was bo'n on the very day Gen'l Grant was buried over again, an' Ah'm goin' to give 'im a name that'll be appoperate."

"You'll call him Ulysses S. Grant Johnson, I suppose," said the friend who was hearing the news.

"No, sah; nothin' so common as that for my boy. Ah'm goin' to name 'im Mausoleum, sah."—*Buffalo Express.*

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper Into All Forms.

By JOHN FULLER, Sr.

Cloth Bound; Size, 10 x 6½ inches; 327 pages; 474 Engravings Price, $3.00

THIS book is brought out to meet the needs of a body of sheet metal workers whose trade has never before been thoroughly described. The author acquired proficiency in copper working through a long apprenticeship and many years of actual labor at the bench. The instruction he gives is, therefore, entirely practical, and will be correspondingly valued by those who are in any way interested in coppersmithing. A special feature of the work is the illustrations, of which there are nearly 500, and which add much not only to the interest but to the value of the text, as they show the work in all stages of progress and illustrate all the appliances, patterns and tools. The work is divided into sections, each treating a separate topic, and is thoroughly indexed The style of the writing is exceedingly simple, and the descriptions of work go into the smallest details, a fact that will be especially appreciated by those who read the book for instruction in this handicraft

"This is a veritable storehouse of information, the descriptive matter and the many illustrations being easy of comprehension. In fact, the whole subject is handled in so masterly a manner that any one with ordinary effort and application cannot fail to understand and appreciate it."—*The Plumber and Decorator.*

"This admirable book has been written with abundant knowledge and a clear head. Mr. Fuller appears to have succeeded thoroughly. His book is singularly simple and clear, and yet very minute in detail."—*Railroad Gazette.*

"The work is the most complete consideration we have seen on this subject, and Mr. Fuller tells his story with clearness and force."—*Fire and Water.*

"The author has so well executed his task that I doubt very much whether any other man living could have done it better. The treatise seems to fully justify his claim that it is entirely practical, and of the publishers, that it is exhaustive; since few will be able to name any article made of sheet copper the practical construction of which, or of some strictly analogous article involving the same methods, is not fully and clearly described in the book, from the laying out of patterns through all intermediate steps and processes to its final completion. The book is a much needed and welcome addition to modern technical literature, and should at once be placed in every up-to-date trade school and technical library."—*Engineering Magazine.*

"Mr. Fuller has happily succeeded in a most difficult task, that of writing a book that is at once a practical reference book, and is at the same time a most readable and interesting one—even to those not especially interested in the subject treated. An evident love for the subject permeates the entire work. We must say a good word for the numerous illustrations, which are lucid and simple."—*American Artisan.*

The Business Situation.

Trade conditions, as a whole, continue satisfactory. In some wholesale lines a diminishing volume of business is reported after the recent activity, buyers having anticipated their requirements to a greater extent than for a long time past. Reports from the retail trade in nearly all sections, however, indicate sustained activity. The most important exception is in the quarantined districts of the South, where trade is almost at a standstill. The drought in the West, too, has proved somewhat of an unfavorable factor, imposing a check on the demand for certain classes of goods, and the mild weather which has generally prevailed delays orders for articles of winter use. Nevertheless, the aggregate volume of business, as reflected in the returns of bank clearings, is shown to be much beyond that of recent years. Last week's returns of clearings from all the leading cities of the country were 27 per cent. larger than a year ago, and 3.5 greater than for the corresponding week of 1892. September's aggregate clearings made the largest total for any month since January, 1893—namely, $5,521,933,332, an increase of nearly 15 per cent. over the previous month and of more than 50 per cent. as compared with September, 1896. The record of recent commercial failures, too, furnishes striking testimony to the improvement in business. According to *Dun's Review*, failures during the third quarter of the current year were only $28,963,000 in liabilities, the smallest total of any quarter for five years. Only six quarters in 15 years have shown smaller liabilities, while the average of liabilities per failure was the lowest in any quarter for 23 years. Railway earnings, exports of grain, cotton and manufactured products, and practically all the factors which influence the commercial world, remain favorable. The heavy volume of exports, combined with a sharp revival of buying interest in American securities abroad, have operated to bring foreign exchange down again to a level which indicates the early resumption of gold shipments to this country. Money rates are stiffening, owing to the active demand for funds for crop moving and industrial purposes. Commercial paper is in better demand, more city banks having come into the market as buyers, while the supply of good material is increasing. Heavy inquiries are noted in iron and steel lines, and the mills are forced to decline to enter contracts in many cases on account of the full condition of their order books. No very noteworthy changes in prices are recorded for the week, but such as occurred were generally in an upward direction.

The Price of Gas.

Hearings which are now being given by the City Council of Philadelphia to representatives of companies desirous of contracting for the lease of the municipal gas works, have elicited some interesting information in regard to the price at which gas can be supplied to private parties in cities similarly circumstanced to Philadelphia. One concern, the Philadelphia Gas Company, who will guarantee to the city an annual rental beginning at $1,000,000 a year, state that they would be prepared to furnish gas to consumers beginning at about 83 cents per 1000 feet and gradually reducing the cost from that figure. If the city's rental came off this figure, the company's representative states that consumers could have gas at 50 cents per 1000 and less. This company would supply water gas exclusively. Another concern propose to take charge of and conduct the city gas works at a uniform rate of 85 cents per 1000 feet for 30 years, giving 10 cents per 1000 feet as rental to the city. From these statements it seems clear that in the majority of cities the community is paying a price for gas out of all proportion to the cost of manufacture. It is generally conceded that recent improvements in gas making machinery have largely reduced the cost of production and swelled the profits accruing to the gas companies.

The Indiana Labor Commission.

The State Labor Commission of Indiana have been remarkably successful in settling strikes in some of the great industries of that commonwealth. The coal strike was of course a specially complicated question, as it extended over several States, and no discredit attaches to the failure of local arbitration boards to effect a settlement. In other cases, however, which were quite important to a number of communities, the commission won laurels by their ability to bring the warring interests together and securing harmony. It is naturally easier to adjust a labor trouble when times are improving and prices are stiffening than when values are drooping and employers are compelled to use the most rigid economy, but honor should be given wherever it is due, and the Indiana commission are certainly entitled to praise for what they have done. Other State boards of labor or of arbitration should be equally alert and efficient.

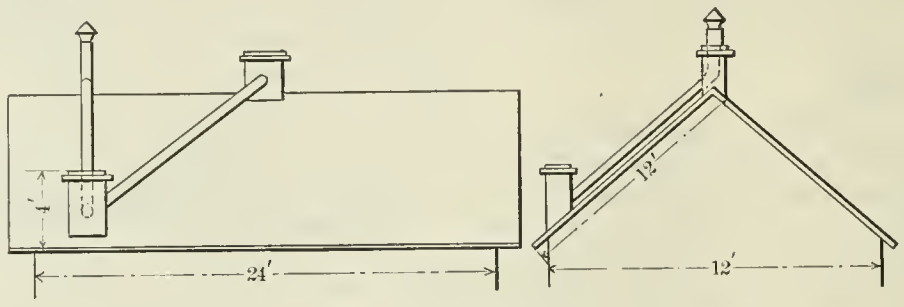
Major Handy, Commissioner-General of the United States to the Paris Exposition of 1900, who has begun his labors at the French capital, advises Americans who wish to make exhibits there to secure their space without delay. The total room allotted to this country is limited and there is no chance of obtaining more. So intending exhibitors should lose no time in putting in their applications.

E. C. Hegeler of the Matthiessen & Hegeler Zinc Company, La Salle, Ill., returned from Europe on the 29th ult., after a six months' sojourn on account of his health. His fellow townsmen gave him a public reception on his return as an evidence of their esteem.

THE LETTER BOX.

Wants Help with a Poor Draft.

From W. W., Bridgeville, Del.—Will *The Metal Worker* kindly tell me which will be the best way to secure a steady draft to a chimney that is on the southeast corner of a roof and extends about 4 feet above the eave? The house has two gables, one north and one south. When the wind is blowing from the east the chimney will not draw effectively and the rooms are filled with gas. The house is heated with hot water. My first plan is to run the galvanized iron pipe 6 inches from the roof, with the same slant as the roof, to the ridge, where it would be finished with a chimney top. A second plan is to run the pipe 6 inches from the roof to another chimney that is in the middle of the ridge, about half way from each end of the roof, and connect the pipe with it. A third plan is to extend the chimney straight up with bricks above the hight of the ridge. This plan, however, has the objection that it is likely to be blown down. If either of the first two plans is favored, what gauge of iron would be best to use? A sketch of the roof with the location of the chimneys is presented herewith in order that my case may be more readily understood.

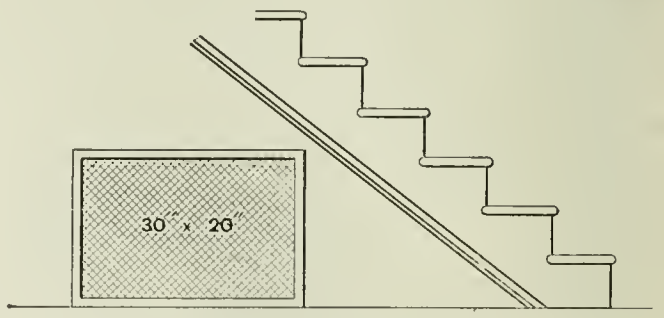


Wants Help with a Poor Draft.

Note.—As has been previously stated in *The Metal Worker*, the chimney problem is one entirely too perplexing for us to solve, and we invite the assistance of the readers of the Letter Box, and would refer our correspondent to the answer given under the head of "A Chimney Difficulty" in *The Metal Worker* of September 25, 1897. Of the three plans the best is to extend the chimney full size up to a point where the wind blowing over the roof will have no bad effect upon it, and to stay the chimney with such iron braces as will prevent any possibility of it blowing away. Improvement might be reasonably expected from carrying a sheet iron pipe up to the ridge of the roof and finishing with a chinmey cap, but the pipe should be double, otherwise the smoke in transit might become so chilled as to be sluggish in movement and defeat the desired end. It is stated that the chimney is used for a hot water heater, and knowing that ordinarily the construction of these heaters is such as to effect an indirect draft, the manufacturers of them generally state that they require a larger chimney than is found in the ordinary house, and as our correspondent does not state the size of the chimney, it is possible it may be too small. There is no doubt that correspondence with the manufacturers of the heater will determine whether or not the boiler in use requires a larger chimney than the one to which it is now connected. If the heater is to be connected with the chimney at the center of the roof better results will be derived if the connection be made in the cellar than by means of a pipe running across the roof on the outside.

Side Wall for Hall Cold Air Register.

From Anti-Friction, Owego, N. Y.—In answer to the inquiries of "Heating," in *The Metal Worker*, September 25, I have seen jobs where the cold air face in the hall to supply the furnace was placed in the side wall and everything worked finely. There is one thing that must be borne in mind, and that is the difference in the weight of air is less to operate the job than where the air is taken from out of doors; consequently everything must be done to lessen the friction of the air currents. The cold air face must be of ample capacity to pass the necessary amount of air to supply the furnace. More important yet is the size and shape of the cold air connection all the way from the face to the furnace. An ordinary partition stack will by no means answer the purpose. The pipe or box must be square, or nearly so; not a shallow wide one. I have seen the space under a stairs used for this purpose, as shown by Fig. 1, which shows a front elevation, and Fig. 2, which shows a side elevation of a connection for a 40 inch portable furnace supplying two 8, two 9 and two 10 inch hot air pipes. It will be found on calculating that the cold air supply is slightly in excess of the hot air supply, which is as it should be when the air is taken from house. A balanced damper was placed in the vertical pipe so that when the air supply from out of doors was used it could not blow up the house supply pipe and cool the house. This method avoids cutting the carpet



Side Wall for Hall Cold Air Register —Fig. 1.—Showing Register Connected to Box Under Stairs.

and prevents sweepings or other light matter being carried down into the furnace to be turned into "incense," as one might infer from the words used when it is seen to arise. When no stairs are handy for use a hall bench or seat or some other device must be supplied to give the connection at the face the proper size and shape.

Those who have had the most experience in ventilating know that air does not flow out of the average vent stack as it does out of doors or windows, and where there is so little inducement as is provided in a partition vent flue I

doubt if such a system would work very well without an exhaust fan in the attic. But being a firm advocate of providing a pure atmosphere in the home, I think the system proposed, with some additions, would be of enough benefit to more than repay the cost. I have seen a ventilator used on the top of a building connected with the

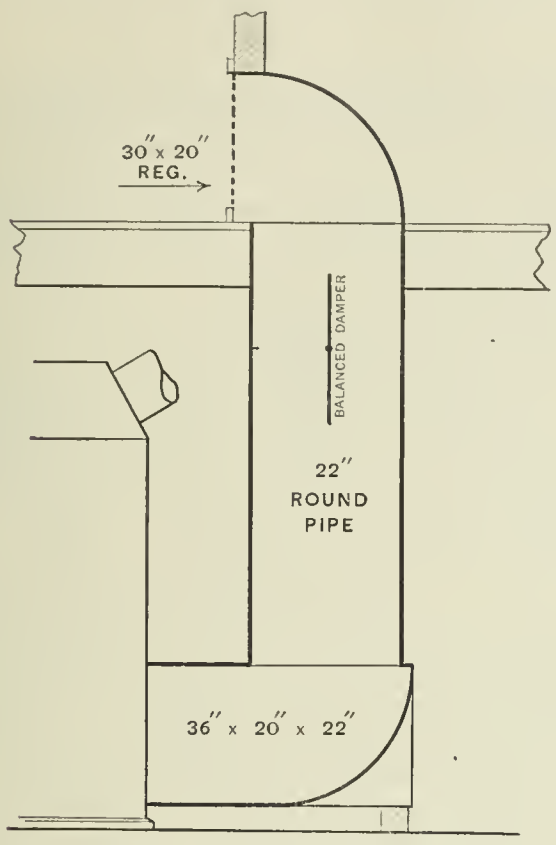


Fig. 2.—Side Elevation, Showing Pipe to Furnace.

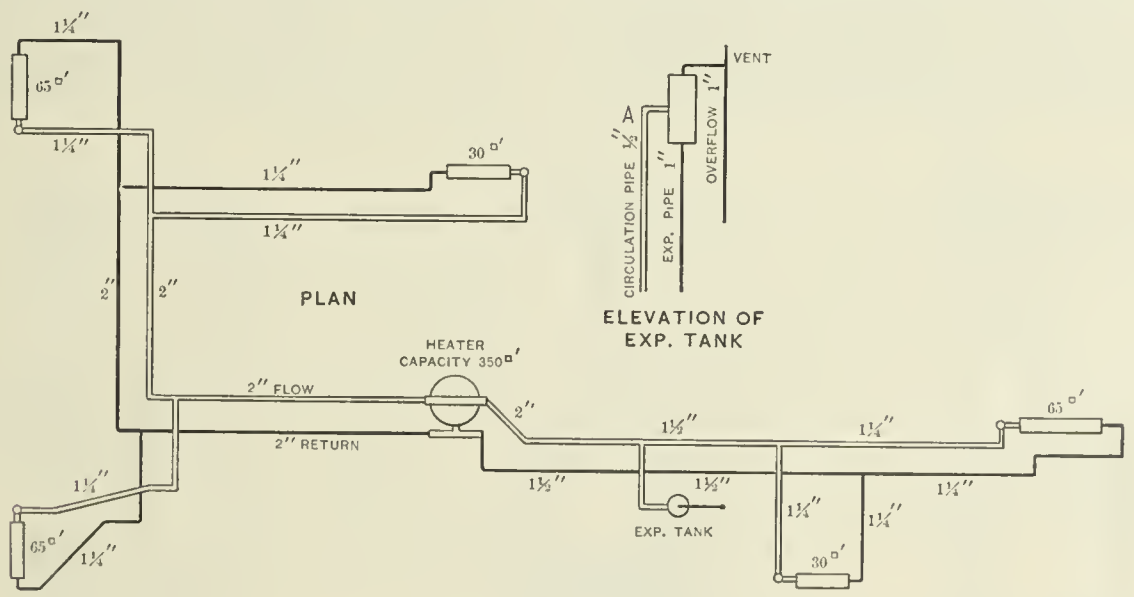
vent ducts to exhaust the air from a building. On page 32 of *The Metal Worker* of June 5, this year, in the description of the ventilation of a fine residence, it is stated that a ventilator is used for this purpose. If my friend "Heating" will connect his vent stacks with some such a ventilator he will avoid any risk of having a cold attic. If it fails to work when the wind is not blowing, and his customer considers ventilation worth paying for, let him heat the receiving shaft with an atmospheric gas burner arranged properly for the work.

Is the Job Planned Correctly?

From A. F., Troy, N. Y.—I would be pleased to learn if the inclosed plan of a hot water heating system of the open tank pattern which I wish to put in my house is correct. I have the boiler and radiators and want to find out if I pipe it as shown will it work all right. Are the pipes too large, and, if so, why, and what sizes would you suggest in their place? I intend to take all the branches out of the top of the main. The radiators are all on the floor above the heater.



Is the Job Planned Correctly?

Answer.—There is nothing shown in the proposed system that would prevent its successful operation. In putting up the piping a liberal pitch should be provided, so that any air which may enter the system may also readily find an exit through the air valves that will be needed on the radiators. The size of the flow main and the return main must be the same wherever branches are connected for radiators, otherwise the circulation will be impeded. The tables used in the trade for mains give a 1½-inch main as having capacity for supplying from 90 to 140 feet of radiation and a 2-inch main from 140 to 200 feet, depending on the length, the exposure of the mains and the friction due to bends. From this it will be seen that the 2-inch main running to the left is ample and that a 1½-inch main might be used to supply the radiators at the right. There are no objections, but rather some advantages to be gained from the use of large mains where there is ample heating capacity in the boiler. If the expansion tank is in an exposed place the running of the ½-inch pipe A from a convenient point on the flow main and connecting it below the water line in the expansion tank will keep up the circulation and prevent freezing. If the expansion tank is placed where a pipe may be run up from it outside of the building an elbow should be put at the top of the tank and the pipe run up from a T placed for the overflow pipe. By piping in this way the elbow will prevent water being forced directly upward should steam be generated in the boiler by excessive firing. These suggestions, however, are not essential for success, and the job as planned will circulate if the work is properly done.

The International Cooling Company, 32 Pine street, New York City, are about completing a central refrigerating plant on Washington street, New York City, near the Gansevoort Market. The plant will have sufficient refrigerating capacity to supply not only the requirements of the market, but also a number of buildings in the vicinity in which cold storage is a feature. The idea of the company is to extend from this central plant street mains so that connections can be made the same as with the mains for water and gas, and restaurants, hotels, groceries and others needing refrigeration may install such apparatus as may be needed in their buildings to supply them from the street mains. The company have systems of a similar nature working in Denver, Col.; St. Louis, Mo., and a very efficient system at Atlantic City, N. J., where all the cooling in a number of the large hotels is done by means of their system.

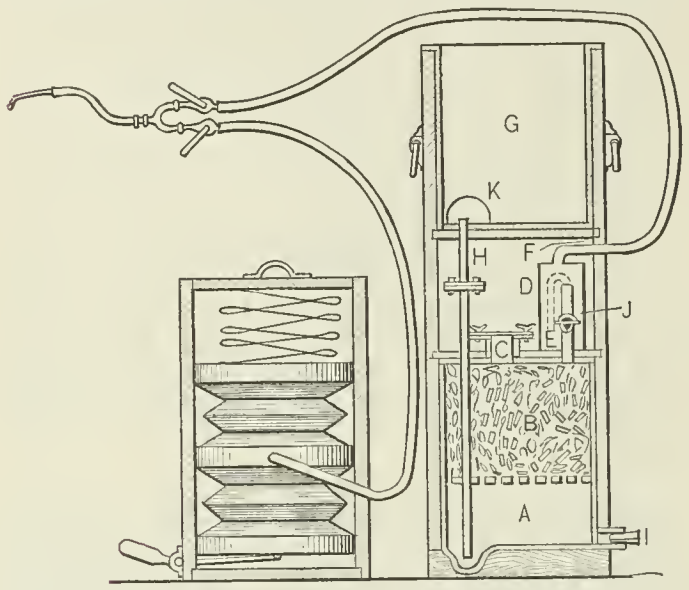
The American Tube & Iron Company have notified the employees at their works at Youngstown, Ohio, of a general increase of 10 per cent. in wages, to take effect on October 26.

The plant of the California Brass Works, San Francisco, Cal., was damaged by fire recently to the extent of $10,000.

HEATING AND PLUMBING.

LEAD BURNING MACHINES.

The mystery that formerly existed in reference to lead burning and the apparatus for doing the work has been almost entirely removed, and *The Metal Worker* has contributed not a little to this end by the various articles and illustrations it has printed in the past. There remains the mystery of the art of burning the seams in various



Lead Burning Machines.—Fig. 1.—*Machine Composed of Generator and Bellows*

positions, and this can only be conquered by practice. All that is needed for practice is the machine properly equipped and charged, a shave hook and some sheet lead, the heavier the better for a beginner. The lead to be joined must be cleaned—not nearly clean, but absolutely clean, for every little speck of dirt hinders a good connection. Then the flame from the burner tip must be applied with a circular movement, covering a circle ½ inch in diameter, and as the lead melts the flame should be moved in a way to push the molten drop where it is wanted.

Various styles of machine are used for the work, and we have reproduced here from the *Plumber and Decorator* of London the sketches and descriptions sent by two competitors in answer to the fourth of a series of prize questions covering the plumbing trade. The question was:

"Sketch in section the best kind of plumbers' lead burning machine that you know of, and describe how to charge it for use."

The answer given by R. Kieley is as follows, and refers to the machine shown in Fig. 1:

"To describe the machine: A is a small space covered with a false bottom, made of a piece of perforated sheet lead, and supported on pieces of pipe. B is a chamber, usually filled with scrap zinc or small bars of spelter. The zinc is put into the chamber B through the small manhole C, and rests on the perforated lead bottom. D is a pipe from the top of the gas generating chamber leading into the wash bottle E, and F is a pipe from the bottle E, to which is connected the india rubber tubing for conveying the gas to the burner. G is the acid chamber and H a pipe to convey the dilute acid down to the bottom of the well in the gas generating chamber. I is a small pipe for emptying the machine when out of use. The wash bottle E is also intended to cut off direct communication between the generating chamber and the flame. J is a stop cock for turning off the gas.

To charge the machine put about 7 pounds of zinc clippings into chamber B, 3 quarts of water and 1½ pints of sulphuric acid into chamber G; a pint of acid is added about every two hours. The zinc lasts about eight or ten days. The saturated acid should be drawn off each time after using.

"For neat burning we must pay attention to the bellows, as the air should be driven at a moderate and equal speed. A good test to indicate if the mixture and force of the current be duly regulated is to apply the hottest and most reductive point of the interior flame to a piece of shaved lead; the heated point becomes immediately as bright as silver, and the flame itself assumes a violet tint, produced by the volatilization of a small portion of the lead. When there is too much or too little air the heat is not so intense or pointed and the melting spreads over a larger surface owing to its being heated more slowly.

"K, in the acid chamber, is a heavy perforated lead cap to break the violence of the escaping gas."

The answer sent by another competitor, whose name was not given, includes sketches of three different ma-

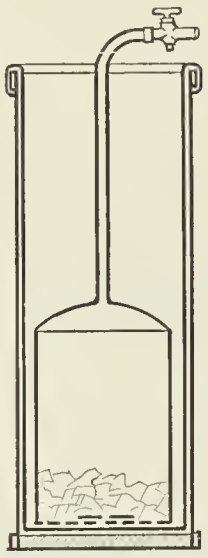


Fig 2.

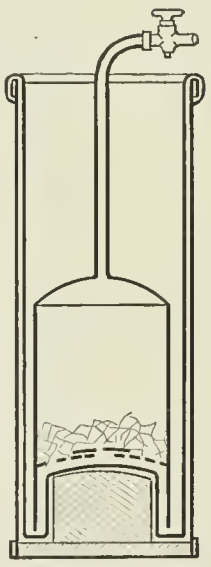

Fig. 3.

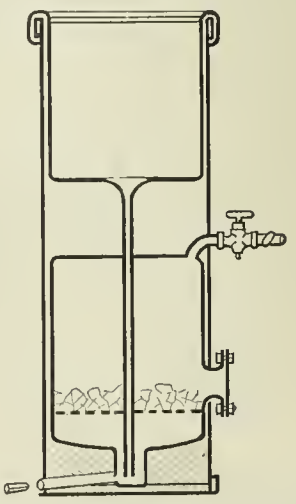

Fig. 4.

Three Styles of Machine.

chines, and their construction and use are described as follows:

"Figs. 2, 3 and 4 are sketches of three kinds of lead fusing machines or hydrogen generators.

"Fig. 2 is the simplest in construction and is much used in chemical works. It consists of an outer case of wood or sheet iron, lined with 4 or 5 pound sheet lead, and an inner vessel called an "ometer," made of lead with a perforated bottom and a pipe leading from top with a tap on end for connecting to rubber tube. Zinc spelter is placed inside the ometer (sufficient to cover the bottom) through a hole left in the bottom, which is afterward closed with a small piece of sheet lead laid loosely over the hole inside.

"Water is then poured into the case until it becomes nearly three parts full, then rectified vitriol (free from arsenic) is poured in, in proportion about 1 part to 8 parts of water (according to the strength of the acid).

"The tap should now be opened to let out the air contained in the ometer, when the dilute acid will flow into the ometer and come into contact with the spelter.

"If there is sufficient acid, gas will now be given off into the ometer and the dilute acid will be forced back into the outer case. If this does not take place more acid will be required. If the acid rises rapidly and the gas comes bubbling through, it will be better to add more water, which is soon learnt by experience.

"The chief objection to this make of machine is on account of it continuing to make gas after all the acid has been forced out of the ometer, owing to the spelter lying on the bottom aud always being in contact with the acid. It is therefore very wasteful unless the ometer is lifted out of the acid every time the gas is not being used.

"Fig. 4 is designed to obviate the waste of gas without the necessity of altering any part of the apparatus.

"In this case the spelter is introduced through the hole on the side, which has afterward to be made gas and acid tight; the acid and water is then poured into the top chamber, whence it flows down the pipe, on letting out the air from lower chamber, and comes in contact with the spelter; thus the gas is generated, and, if the tap be closed, will fill the lower chamber, driving the acid back up the pipe into the top chamber, until the acid is below the level of the spelter, and thus no more gas is generated until the tap is opened and the gas used. Thus none is wasted, and this constitutes the chief advantage of this machine over the previous one described.

"The great objection to this, however, is the difficulty of cleaning it out and charging with spelter; also the liability for the pipe to become blocked with crystals of zinc sulphate, which necessitates the dissolving out with hot water.

"In order to combine the simplicity of the former with the economy of the latter, I designed, and have used for some time, a machine as shown in Fig. 3, and find it answer admirably, the difference between this and the first described being in the trapped portion at the bottom of the ometer, which has the effect of leaving the spelter clear of the acid when the ometer is full of gas, thus not generating and wasting gas when not in actual use.

"It is also very easily charged and cleaned by lifting the ometer out of the case and laying it on its side upon the bench; there is no small pipe to become blocked by crystals and no joints to be made good every time it requires spelter. It is also much less costly in the first instance than Fig. 4."

A Rule for Chimney Capacity.

There is an old rule of thumb for chimneys, says the *Boiler Maker*, assigning 1 square foot of grate per horse-power of the boiler, and from one-tenth to one-eighth the area of the grate for the area of the chimney, varying the hight to make up for required draft. A more definite system of computing chimney power is in use by engineers, by which the quantity of coal to be consumed on the grate per hour and per square foot, with an allowance for the friction of the gases in the chimney, form the basis of the formulas for size and hight of a chimney. A formula based on a consumption of 5 pounds of coal per square foot of grate per hour is much used, in which the horse-power required and an assumed hight of chimney are factors. Then

$$\frac{\text{Horse power}}{3.33 \times \sqrt{\text{height}}} = \text{effective area},$$

which must be increased by its square root × 0.8 for the actual area to allow for friction. In this way valuable tables of sizes and hights of chimneys for any horse-power and for both brick and iron chimneys of round and square form have been made.

Plumbing in Australia.

A writer in an Australian paper announces that the Melbourne Board of Works have ordered owners of property iu certain localities to conform to the new regulations in reference to house draiuage, and he gives the following in reference to the details of the present system :

Polluted wastes are discharged into the nearest surface drains and excrementitious matter is stored in earth pans and removed periodically. Thus the surface drains are always carrying foul water, and it is necessary to employ a considerable number of men to keep them clean. The operation of sweeping, more especially iu the suburbs, is very offensive, and the methods of removing the sweepings unduly insanitary. In the center of the city these conditions are somewhat mitigated by the coustruction of underground drains. The article then treats of their new sewer system as applied to house drainage, which is very similar to the plumbing regulations of the up to date American cities. It requires that the work shall be done by a licensed workman who has shown his proficiency before an examining board. Plans must be filed with the proper official when a permit is applied for to do the work. The existing plumbing in a piece of property where work is to be done must be approved by an inspector before the new work can be commenced. The regulations provide that traps shall be ventilated, and that intercepting traps shall be used betweeu the house and the sewer. The new regulations are evidently a great advance over the method heretofore followed in Melbourne for the disposal of household waste.

The Plumber and the Heating Contractor.

BY ONE OF EACH.

In a discussion between a number of tradesmen, some who did only heating, some plumbing alone, while others did both kinds of work, the question was asked why it was that the heating contractor had to meet but very few legal requirements, but was held to much stricter account for his work by his customers than the plumber. To the disgust of the plumber, one heating contractor claimed that the heating contractor had to be a more intelligent man than the plumber because of the nature of his work. The discussion was fast taking the form of an argument when one man who did both kinds of work ventured to state that if a plumber and a heatiug coutractor were to do work of about the same cost in a building, and if the plumber's work was badly done it would probably remain undiscovered for a long time, and cost the plumber nothing, while if the heating contractor's work was badly done the first few days of winter would demonstrate this, and the deficiency would have to be made good, and in many instances a portion of the purchase money would be held until a weather test was made of the work.

A little reflection on the part of those present brought forth the agreement among the plumbers that a most rascally job could be done where there were no stringent regulations and inspection was not required, and the owner remain ignorant of it until some dire calamity had visited him to bring it to his notice, and then, in all probability, there would be no redress, and the owner would have to bear the expense of remodeling as well. Those present who had done heating work testified to the uniform practice in their trade to guarantee to provide a given temperature under specified conditions, and the business reputation and responsibility of the house were involved before a contract was placed in many instances, so that the buyer might be sure that any defect that might

be discovered would be made good. A slight error in judgment in some detail might necessitate a considerable expense in a heating plant to make it right, while a vent pipe could be run into a partition and stop there instead of being carried to the roof, and other similar pieces of rascality in the plumbing line might pass unnoticed for years.

The custom of the public has been to hire any man who hung out a sign as a plumber, providing his price was low, the only restriction being that their property should not be deluged with water, which seemed to be the only guide as to efficiency. The movement on the part of good plumbers and the health officials to set up other standards of efficiency is, however, rapidly overcoming this evil. The heating man, on the other hand, while meeting just as sharp competition from low prices, is forced for self preservation to understand his business well enough to know in advance the amount of heating the plant he provides will do, for in the event of failure he must at his own expense supply whatever is necessary for success. If this does not require the heating contractor to be more intelligent, as was inferred, it certainly makes him more careful, for while people may be careless of their health they are very exacting in what affects their comfort.

Gas Engine Water Heating System.

Through the courtesy of the *American Gas Light Journal* we are enabled to present a sketch and the following description of a novel heating system :

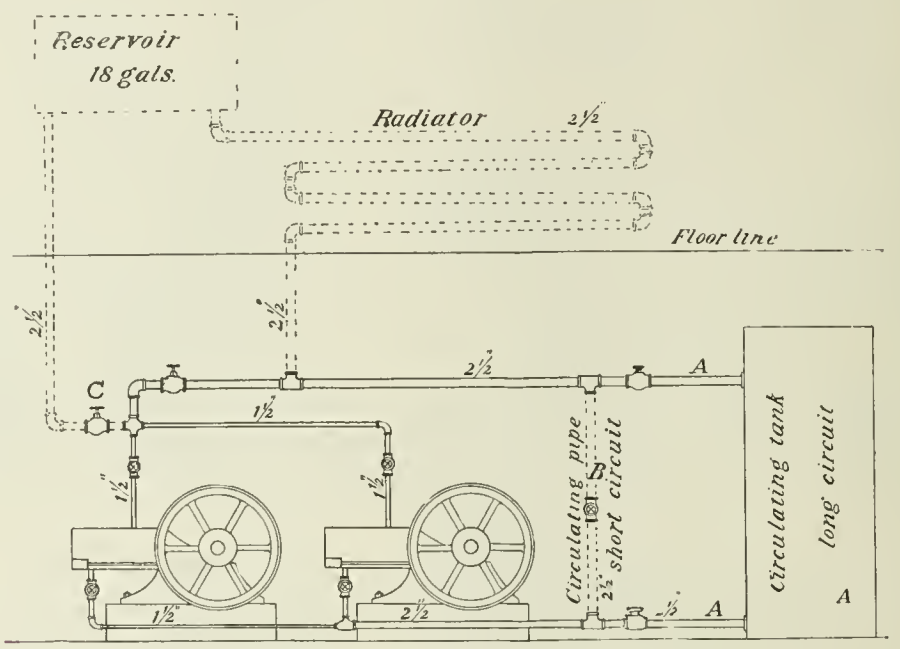
A gentleman prominent in the management of the Grand Rapids (Mich.) Gas Light Company, writing under date of September 22, says that Mr. William Widdicomb, a resident of Grand Rapids, and a prominent gas consumer, has successfully used the heated water from a gas engine water jacket to warm the corridor of his office building. He uses two 13 horse-power gas engines to pump water for elevator service. The water jackets of these engines were cooled by the usual method of tank circulation, as shown by the continuous lines in the accompanying sketch. The system was extended, as shown by dotted lines, the hot water being carried first to a small reservoir at the highest point in the system, thence descending through a series of hot water radiators back to the basement.

The dotted pipe B was placed to secure a more direct circulation than was had through the tank, and suitable shut offs were placed to change the course of the water through the short circuit B, in cold weather, or the long circuit A, in warmer weather, the circulation during the summer months, through reservoir and radiators, being entirely cut off by means of the valve C.

Mr. Widdicomb has also arranged to supply hot water for the barber shop on the second floor of the building by passing the gas engine exhaust pipe lengthwise through an ordinary 30-gallon kitchen circulating boiler, located in basement with engine. The heated water was carried up to shop by piping, ending with the usual tap. Water is thus constantly supplied at almost boiling point in the barber shop.

Pittsburgh's Public Bath House.

The public bath house that is being erected at the corner of Penn avenue and Sixteenth street, Pittsburgh, will be completed and opened to the public about November 1. The structure, with its completed arrangements, is the gift of Mrs. William Shaw, Jr. The building is fire proof throughout, the only wood used in its construction being the door and the interior of the waiting room. The bath house proper, which runs back along Sixteenth street, is only one story high. It has two apartments, each containing 12 bathrooms, 11 for shower baths and one with a tub. The partitions are all highly polished marble slabs. Each bathroom has a furnished dressing room in connection. This bath house is being erected under the direction of the Bath Committee of the Civic Club, of which Dr. Thomas Turnbull of Allegheny is chairman. It is especially intended for the working people who have no means of bathing in their homes or elsewhere. The nominal low sum of 5 cents will be charged for the use of a bathroom, thus bringing their use within the means and reach of the poorest people. Dr. Turnbull states that if profits will be made at this rate the price will be reduced to 4 or probably 3 cents for the use of each bathroom. The only object for charging admission is to defray the operating expenses. The building will probably be open from 7 a.m. to 9 p.m.



Gas Engine Water Heating System.

Powell's Plumbers' Brass Goods.

We have received from the William Powell Company, Cincinnati, Ohio, their new catalogue No. 6, devoted to plumbers' brass goods. The catalogue consists of 126 pages, bound in a salmon colored cover, with the words "Powell's Plumbers' Brass Goods" in embossed red letters on the front cover. The first inside page is printed in red, and the reader is asked to notice that they manufacture a line of high grade steam goods. The next page shows a bird's eye view of the plant of the company. The first three pages are devoted to the Star bath. sink and basin plugs, followed by 30 pages devoted to polished and rough stops and wastes for a variety of purposes. Powell's compression bibs, basin cocks and bath cocks occupy 30 pages, when a variety of Fuller bibs of improved pattern for all purposes occupy 30 more pages, and the balance of the catalogue is occupied by self closing goods and the smaller specialties which the plumber finds indispensable in his work.

The Patten Mfg. Company have been incorporated at Chattanooga, Tenn., by W. R. Patten and George E. Jamme, for the manufacture of High Grade Plumbers' Cabinet Ware.

New Plumbing Ordinance Proposed for Chicago.

At a regular meeting of the Chicago City Council, held September 27, Arthur R. Reynolds, M.D., Commissioner of Health, presented a communication calling attention to the act taking effect July 1, 1897, providing for the examination of plumbers and the supervision of plumbing work. Commissioner Reynolds goes on to say that after consultation with the counsel to the corporation and with representative plumbers he has prepared the draft of an ordinance which he submits for the consideration of the City Council. The following is a copy of the proposed ordinance :

AN ORDINANCE

To provide for the examination and certification of plumbers.

Be it ordained by the City Council of the City of Chicago:

SECTION 1. That any person now or hereafter engaging in or working at, or representing himself to be engaged in or working at, the business of plumbing in the city of Chicago, either as master plumber or employing plumber, or as a journeyman plumber, shall first obtain a certificate therefor, as hereinafter provided.

SEC. 2. Any person desiring to engage in or work at the business of plumbing, either as a master plumber or employing plumber, or as a journeyman plumber, shall make application to the Board of Examiners hereinafter provided for, and shall, at such time and place as said Board may designate, undergo such examination as to his qualifications as said Board may direct. Said examination may be made in whole or in part in writing, and shall be of a practical and elementary character, but sufficiently strict to test the qualifications of the applicant.

SEC. 3. There is hereby created a Board of Examiners of Plumbers, consisting of three members, one of whom shall be the Commissioner of Health, who shall be (*ex-officio*) chairman of the said Board of Examiners ; a second member who shall be a master plumber and a third member who shall be a journeyman plumber. Said second and third members shall be appointed by the Mayor, by and with the advice and consent of the City Council, on the first Monday following the approval of this ordinance, or as soon thereafter as may be, and the said two members so appointed shall hold office until the first Monday in May, 1898, and thereafter the second and third members to be appointed on the said Board of Examiners shall be appointed by the Mayor, by and with the advice and consent of the Council, annually, on the first Monday of May in each year, and shall hold their office for the term of one year and until their successors are appointed and have qualified. The salary of each of the said second and third members of the said Board shall be $1000 per year.

SEC. 4. Upon the passage of this ordinance the Mayor shall appoint, by and with the advice and consent of the City Council, a secretary to said Board of Examiners, whose duty it shall be to preserve and keep all books and papers belonging to said Board, or which are required by law to be filed with said Board, and to do and perform such other services as may be required by the said Board of Examiners. The person first appointed shall be appointed by the Mayor, by and with the advice and consent of the City Council, on the first Monday following the approval of this ordinance, or as soon thereafter as may be, and shall hold his office until the first Monday in May, 1899, and thereafter the secretary to said Board of Examiners shall be appointed on the first Monday in May, 1899, and biennially thereafter. The salary of the said secretary shall be $1200 per year.

SEC. 5. Said Board of Examiners shall, as soon as may be after appointment, meet at such time and place as the Commissioner of Health may designate, and proceed to carry out the provisions of this ordinance. Said Board shall examine applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilation ; and if satisfied as to the competency of any such applicant, and upon receipt of the fee hereinafter provided, the Board shall issue a certificate to such applicant, authorizing him to engage in or work at the business of plumbing, whether as master plumber or employing plumber, or as journeyman plumber. The fee for the examination and certificate of a master plumber or employing plumber shall be $5 ; for a journeyman plumber it shall be $1. All fees received for said examinations and certificates shall be paid into the City Treasury.

SEC. 6. The Commissioner of Health is hereby authorized to provide office room for the secretary of said Board of Examiners, in the Department of Health ; and all records of the said Board shall be part of the records of the said Department of Health.

SEC. 7. During the current fiscal year, and until the next annual appropriation shall have been made, the moneys necessary to be expended for the payment of salaries of the members of the Examining Board and of the secretary of said Board, and all other necessary and legitimate expenses incurred in carrying out the provisions of this ordinance, shall be paid by the City Comptroller out of moneys not otherwise appropriated ; provided, however, the amount to be so paid shall not exceed the sum of $2500.

SEC. 8. The certificate herein prescribed for master plumbers shall be accepted in lieu of the examination provided for in Section 1417 of the Revised Code of Chicago, 1897, which section is hereby repealed in so far as it is inconsistent or in conflict with the provisions of this ordinance but all other existing ordinances and sections of ordinances relating to plumbers and plumbing shall continue to be operative and in force, unaffected by the passage of this ordinance.

SEC. 9. Any person violating, disobeying, neglecting or refusing to comply with any of the provisions of this ordinance, shall be subject, on conviction thereof, to a penalty of not less than $5 nor more than $50, and upon such conviction or upon conviction of violation of any rules and regulations based thereon, the certificate may be revoked by the Mayor, on recommendation of the Commissioner of Health.

SEC. 10. This ordinance shall take effect from and after its passage and due publication.

The Gorton Soft Coal Boiler.

That soft coal can be successfully burned in heating boilers is demonstrated in the experience of those who are using the Gorton soft coal boiler, made by the Gorton & Lidgerwood Company, 96 Liberty street, New York. Six years of constant use has shown that this boiler will burn successfully the cheapest unwashed coal obtainable, the finest slack and lump together, just as it comes from the mines, and the tubes above the fire do not choke or clog with soot, and require no cleaning.

The fire pot in the Gorton soft coal boiler is so constructed that sufficient additional air is drawn through the fingered ring, at the lower edge of the coking chambers, to ignite all the gases arising from the coking process. This gives perfect combustion and prevents the deposit of soot and unconsumed carbon on the heating surface of the boiler, and makes use of that part of the fuel which is wasted when soft coal is used in ordinary fire pots. The Gorton boiler is said to be the only boiler that will burn soft coal by coking it before it feeds down on the fire. In a recent letter received from a user of their soft coal boiler in Iowa is the following statement:

"I can burn the different grades of slack coal that I can get here, with less dirt and smoke than my neighbors who burn the best lump and nut coal. I heated my house of nine rooms last winter for $27 and some cents."

Similar experience is reported from others who have used the Gorton soft coal boiler—some for the past six years.

NOTES.

A meeting of the Wrought Iron Pipe and Tube Manufacturers' Association was held at Pittsburgh, September 30, at which a slight advance was made in prices. The particulars of this meeting will be found in our Trade Report this week.

J. H. E. Green, a plumber and gas fitter at 209 Pleasant street, Worcester, Mass., is putting in the machinery and material necessary to carry on a sheet metal business.

Elwood Wilson is enlarging his plumbing establishment at Lafayette, Ind.

G. W. Chamberlain and C. M. Hersey of Pittsfield, Maine, have recently purchased the stock and material necessary for a plumbing business. They also have a line of machinery which will enable them to do machine work.

P. J. Hartnett is moving his plumbing shop to 210 Washington street, Newton, Mass.

R. B. Morris and W. W. Otter have been appointed a committee by the Master Plumbers' Association of Houston, Texas, to urge the appointment of a board of plumbing examiners by the Mayor, in accordance with the law passed June 4, 1897.

P. J. Dullanty has been awarded the contract for plumbing the Miller Block, at Ashland, Wis.

George W. Briggs, Omaha, Neb., bid $4150 and was awarded the contract for a Steam Heating Plant for the Hawthorn School Building.

George N. Ainsworth, a well-known plumber of Athol, Mass., was stricken with apoplexy and died at his residence last week at the age of 48 years.

John W. Stewart of the firm of Silas & Stewart, 112 Worthington street, Springfield, Mass., died at his resi-

dence on Friday of last week, aged 58 years. He had been for a long time associated with the steam heating trade, and had once served as an engineer in the State Lunatic Asylum at Brattleboro, Vt. He was a member of several fraternal orders and is survived by a widow.

The Griffith Heating & Plumbing Supply Company of Spokane, Wash., having purchased and remodeled the Plants Building, at the corner of Railroad avenue and Howard street, have removed their entire stock of Plumbing and Steam Fitters' Supplies to their new quarters.

The Master Plumbers' Association of St. Paul, Minn., at a recent meeting passed the following resolution: "*Resolved*, That no master plumber engaged in business in the city of St. Paul shall employ any person working at the trade of plumbing other than those having obtained a certificate from the State Board of Plumbing Commissioners showing his qualification as a competent workman; and we respectfully ask property holders having plumbing work done to see that the plumber doing such work has a certificate of competency."

The firm of H. H. Wicke & Co., Pensacola, Fla., have dissolved by mutual consent, by the retirement of Mr. Wicke. The business will be continued by C. F. Zeek, who has associated with him C. R. Faulkner. The new firm will operate under the name of the Escambia Plumbing Company.

E. L. Jones & Co., Dover, Del., have secured the contract for heating the State House, at Dover, at their bid of $1550.

The Board of Health of Albany, N. Y., have purchased a smoke machine for testing drainage and plumbing systems.

The Plumbers' Examining Board of Hartford, Conn., are busily occupied with applicants for plumbers' licenses, as the law requires that no plumber can work without a certificate after October 1. Among the applicants were F. T. Matox of New York, J. E. Honnan of Brooklyn, N. Y.; George Easton of Westfield, Mass., and M. J. Harrington of Springfield.

A Chicago steam fitter has removed to Christiania, Norway, where he has engaged in business in his old line. He writes to the American Boiler Company relative to introducing their goods, believing that a fine opening exists for the use of American steam and hot water heating appliances. If he succeeds in getting these appliances adoped he will very probably stir things up considerably in that ancient country.

The Fuller-Warren Company, Milwaukee, Wis., are now in possession of a full consignment of patterns and machinery for making Fowler & Wolfe Radiators, having recently obtained the same from the Fowler & Wolfe Mfg. Company of The Bourse, Philadelphia, and have started manufacturing Radiators. The territory assigned to the new makers comprises the States of Michigan, Wisconsin, Illinois, Indiana and all the territory west of the Mississippi River, and they expect to be well able to take care of all orders in their field. The Fowler & Wolfe Company state that the demand for their Radiators is something phenomenal, a number of orders from all parts of the country being received every day, covering the best steam fitting trade in the country.

The E. J. Nolan Plumbing Company have been incorporated at Cincinnati, Ohio, with a capital stock of $5000.

B. E. McDermott has opened a plumbing shop in the Odd Fellows' Building, at North Cambridge, Mass.

Plumbing Inspector Albert S. Whitehead of Allegheny, Pa., testified against and secured the conviction of a plumber who had done work in violation of the health regulations.

The Farwell Heating Company, Atchison, Kan, are putting in one of their Farwell boilers in the Hetherington Building.

The following members of the Plumbers' Examining Board at Hamilton, Ohio, were unanimously reappointed on the expiration of their terms: John L. Walker, John P. Henn, Harry J. Thompson and Jacob Rieger.

The Thayer Heater Company, 32 Oliver street, Boston, Mass., have brought out in very pretty form a pamphlet of testimonial letters, all of which were written during the year 1897, and it is unnecessary to state they all speak in the highest terms of the Thayer heater.

The Alpha Combined Heating & Lighting Mfg. Company of New York City filed a certificate of incorporation at Albany, N. Y, October 6. The concern will manufacture devices for heating and lighting, and have a capital stock of $60,000. The directors are Asael Wells, William Murray, Isaac Mailhouse, Henry Lewis Jeffries and Loren S. Wells of New York City.

The R. S. Blackburn Plumbing Company of New York City have been incorporated at Albany, with a capital stock of $5000, the directors being Charles Blackburn, John Harrison and Thomas Blackburn of New York City.

The Burgess Soldering Furnace Company, Columbus, Ohio, issue a tasteful little illustrated circular and pricelist relating to their extended line of Burgess Gem Furnaces. This firm began the manufacture of Portable Gasoline Soldering Furnaces over a quarter of a century ago, and since then they have been continually improving their apparatus until now they have what they consider the perfection of a soldering furnace. The goods shown in the circular are Tinners' and Roofers' Furnace, Plumbers' and Tinners' Furnace, Tinners', Roofers' and Plumbers' Furnace, Canners' and Tinners' Furnace, Electricians', Plumbers' and Tinners' Furnace and the Gem Paint Burner.

The American Brass Works is the name of a new firm who will soon occupy the top floor of the large Chadborn-Coldwell Mfg. Company Building at Newburg, N. Y. The firm will manufacture special Brass Goods for the building trade, particularly sanitary fittings.

The Charles H. Crocker Company have been organized in Portland, Maine, for the purpose of manufacturing and dealing in Heating Apparatus of all kinds and doing a general business in Tin, Iron and Metal Work. The officers are: President, George H. Allen of Portland; treasurer, Charles H. Crocker of Deering.

Meeting of Black Sheet Makers.

(*By Telegraph.*)

A very fully attended meeting of the black sheet manufacturers of the United States was held in the Conestoga Building, Pittsburgh, on Thursday, October 7. The meeting was called for the purpose of considering the present condition of the sheet industry and to consider the advisability of making an advance in prices owing to a large advance in prices of billets and to the heavy demand for sheets. Out of 35 firms to whom notices of the meeting were sent, 31 were represented in person. N. E. Whitaker of Whitaker Iron Works, Wheeling, W. Va., was chairman, and John Jarrett, Pittsburgh, secretary. After a full discussion of the conditions governing the sheet industry at this time, the following was unanimously adopted:

"*Resolved*, First, that the basis of prices of the sheets be established on No. 28 hot finished steel sheets. Second, that the price on No. 28 hot finished steel sheets be fixed at $2.10 per 100 pounds, and for all steel sheets having one pass through cold rolls before or after annealing, the price shall be $2 15 per 100 pounds, f.o.b., maker's mill. Terms, 60 days' acceptance or cash, less 2 per cent., in ten days from date of shipment."

Prices for other gauges in addition to 28 were fixed as follows:

No. 30, $2.40; 29, $2.25; 28, $2.10; 27, $2.05; 25 and 26, $2.24; 23, $1.95; 22, $1.90; 19 and 20, $1.85.

The steamer "H. A. Root," which has been engaged for some time in raising the cargo of copper from the steamer "Pewabic," sunk off Alpena, in Lake Huron, 32 years ago, arrived at Milwaukee last week with 600 tons of copper recovered from the sunken weck. The "Pewabic" lies in 165 feet of water. A large amount of ingots and milled copper, which was taken out of the vessel, is said to be in perfect condition, the water appearing to have had no effect on the metal notwithstanding its long period of submersion.

The London *Standard* says that a new Russian syndicate, composed of 12 large petroleum companies, is forming to operate the Baku oil fields for a period of ten years from 1898.

The Peruvian Government is offering special advantages to the manufacturers of machinery in the United States in the permanent exposition of all kinds of machinery which is to be inaugurated in Lima on December 9 next. All exhibits will be admitted free of Custom House duties, as well as from consular fees. Full particulars regarding the exposition are obtainable from Carlos G. Estenos, acting Consul-General of Peru in New York City.

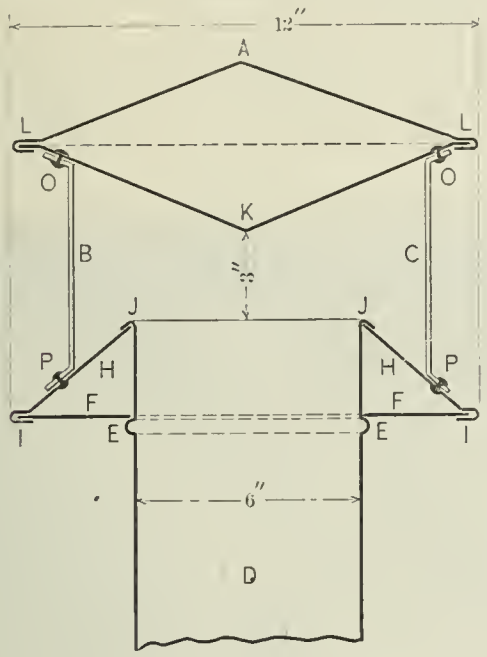
United States Minister Buchanan, at Buenos Ayres, has supplied the State Department at Washington with copies of decrees issued by the Argentine Government inviting proposals for the construction in Buenos Ayres of a central railway station to cost about $4,000,000. Bids from citizens of the United States will be invited through the Argentine Legation in Washington.

SHEET METAL WORK.

PATTERNS FOR AN EMERSON VENTILATOR.

BY W. N.

One of the many articles made in the tin shop by the sheet iron worker is an Emerson ventilator. The diagrams presented herewith show the method of drawing the ventilator in proper proportion, and the methods of



Patterns for an Emerson Ventilator.—Fig. 1.—*Sectional View.*

obtaining the patterns by the short rule. While the rule which will be presented will not be strictly accurate, it varies so little that it is applicable to any shop practice.

In Fig. 1 let A B C D represent a sectional view of the ventilator, giving dimensions and method of construction. When drawing the ventilator the rule used to proportion it is as follows: If the stack D is 6 inches, the hood and flaring piece H H, below, will be twice that amount, or 12 inches, as shown, while the distance from the apex of the deflector K to the top line of the stack J J will be one-half the diameter of the stack, or 3 inches. In the construction of the stack, E E is a bead made in the beading machine, on which the bottom of the ventilator rests, while H H is seamed to the bottom at J J, the stack being flanged over H H at J J. The hood A and deflector K are seamed together at L L, while the braces C and B are soldered, bolted or riveted at O O and P P. If the braces are bolted or riveted, then this must be done before seaming the various parts together.

In Fig. 2 are shown the shop rules for obtaining the patterns, one-half of the elevation only being required. For the pattern for the brace F bend off a piece of band iron of the required thickness, with flanges having holes punched into same to admit rivets or bolts at H and H, corresponding to angles at H and H. For the pattern for the stack obtain the circumference of the pipe and run a bead around the pipe at a distance equal to I O or J P from the end.

In laying out the drawing for hood and deflector, have the distance E A and E D equal, so that the pattern for one can be used for the other.

For the pattern for the hood proceed as follows: With A as center and A C as radius, describe the arc V U. Draw a line from A to V. Now set the dividers equal to E C, or half diameter, and, commencing at V, step off three spaces, shown by M M U. Draw a line from U to A. Then will U M M V be the half net pattern for hood and deflector. On the deflector pattern add a single seam, and on the hood pattern a double seam.

For the pattern for the flaring piece J L extend the line J L until it intersects the center line at W. With W as center, and W J and W L as radii, draw the arcs J J^1 and L X At any convenient point draw the line X^1 W, intersecting the inner arc at N. Set the dividers equal to I J or O P, or half diameter, and, commencing at N, step off three spaces, shown by N^1 N^1 J^1. Draw a line from W to J^1, extending it, cutting the outer arc at X. Then will X X^1 N J^1 be one-half the net pattern for flaring piece I J L O. Allow for double seam along the arc X X^1, as required at L. For the pattern for the bottom

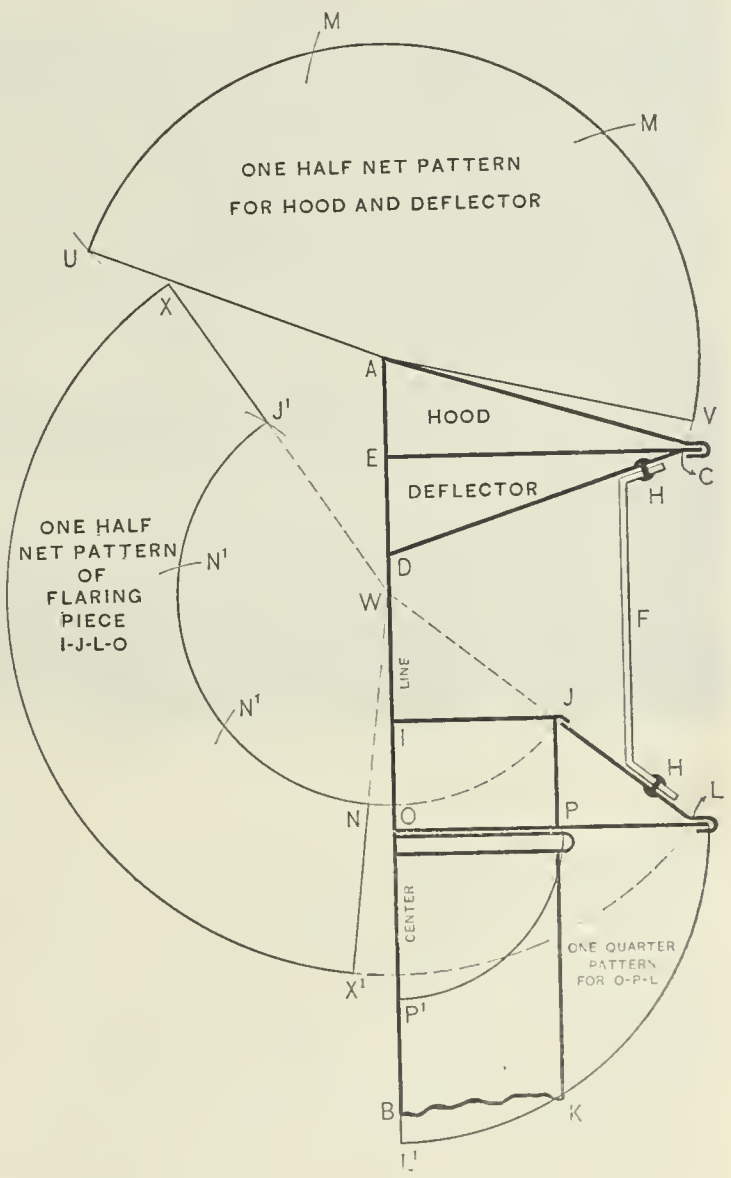


Fig. 2.—*Shop Rules for Obtaining the Patterns.*

P L take O as center and O P and O L as radii and describe the arcs P P^1 and L L^1, intersecting the center line A B extended at P^1 and L^1. Then will P P^1 and L L^1 be one quarter of the pattern for bottom O P L.

The Illinois Steel Company will not again operate the Sheet mill at Hammond, Ind., which they leased some time since from the Corning Steel Company. They are tearing down the galvanizing plant which they erected there and will remove it either to South Chicago or Milwaukee. It is not known whether the Corning Steel Company will operate the plant, but it will most likely stand for some time.

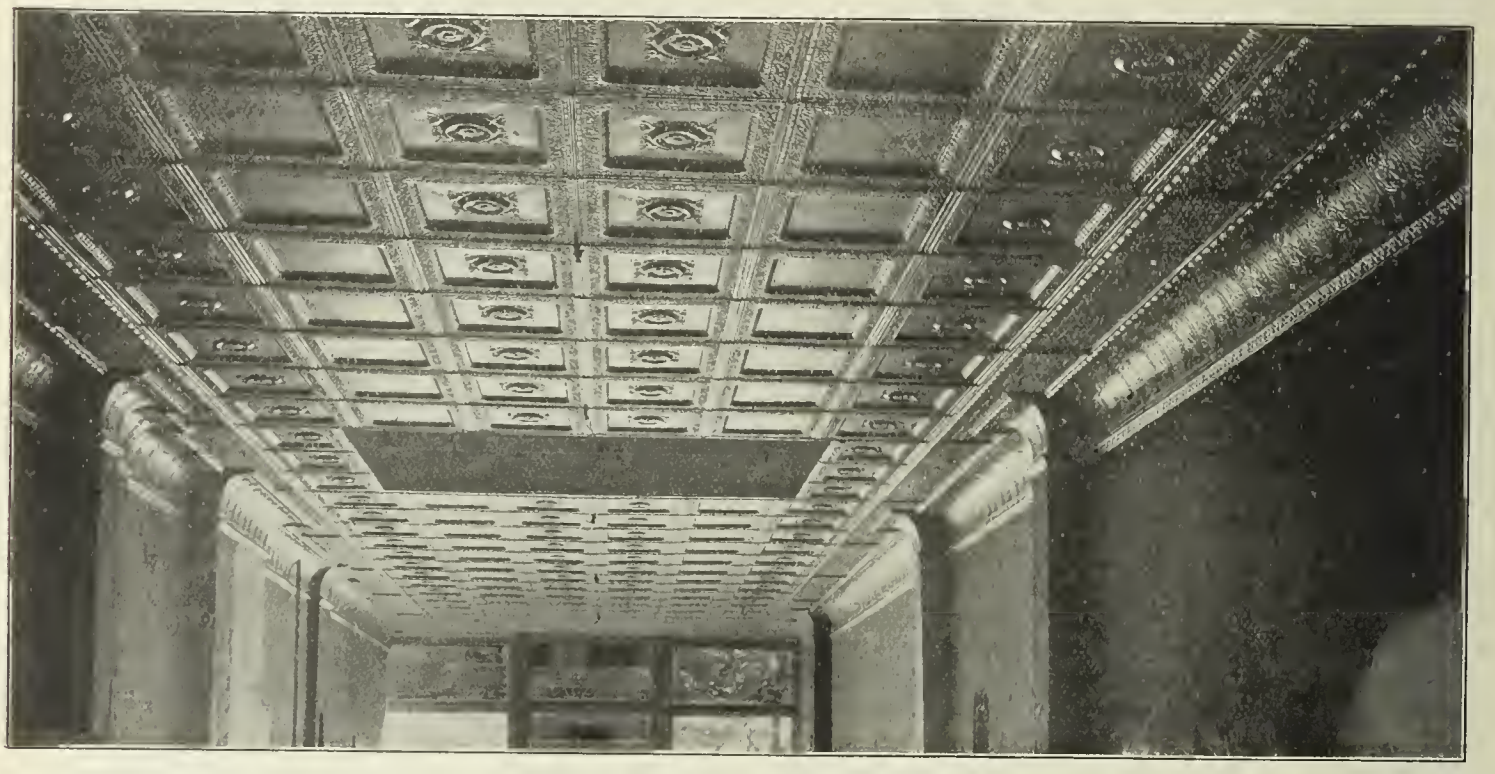
Modern Tinsmithing.

A visit to the shop of F. S. Burrows, whose office is at 107 Beekman street, New York City, discovers a variety of sheet metal productions that could only be turned out in what may be truly called a modern tin shop. In former days the tinsmith was kept busy in making articles that are now produced in the large factories by the stamping process. The tinsmith, however, has not been entirely suppplanted by machinery, and the services of the expert workman are still in demand for making various specialties which often are not produced in sufficient numbers to warrant the expense of the costly machinery that would be necessary for their production by power.

In the shop of Mr. Burrows is found a collection of small machines adapted for various special requirements with such machinery of heavier character as can be readily operated by hand power. Having devoted his time to the manufacture of specialties, his business is largely the making of patented articles of peculiar construction which require perfect fitting and neat workmanship, such as was the pride of the old time tinsmith. Among the examples of fine work which have been turned out in this shop are what is known as a bug gun for killing insects, a washing machine which is a credit to the shop in the character of the workmanship it displays, and one of the latest productions is a machine for washing "pay dirt," designed for use in the placer gold bearing districts. This machine is designed to separate the gold from the dirt, and much larger quantities of dirt can be washed by one man in less time than can be done by hand washing. In the construction of the troughs, which are designed to catch the precious metal as it is carried along the sluiceway of the machine, a uniformity of workmanship is shown that could not be surpassed if they were manufactured by machinery. In the production of these specialties the ingenuity of the tinsmith is often taxed, and templates, disks and peculiar looking tools and parts may be seen throughout the shop.

Fine Example of Sheet Metal Ceiling Work.

By means of the half-tone engraving presented herewith we show the interior of a restaurant at 2605 Olive street, St. Louis, Mo., which is finished with a very handsome pattern of sheet metal ceiling with cove, just executed by the American Corrugating Company of that city. The room has an area of 81 feet 9 inches by 21 feet 4½ inches, and in the treatment of the ceiling the company make use of plates 32 inches square with 1⅜ inch relief, and of German Renaissance design. The plates with both the plain and enriched center are stamped from one sheet of metal. A full lap of the mold extends around each intersecting panel, thus making a thoroughly dust proof and invisible joint. The ceiling was put up over plaster and the furring was leveled before any of the plates were put in position. In some places the furring touched the plaster, and in others it was necessary to fur down as much as 3 inches.



Fine Example of Sheet Metal Ceiling Work.—Interior View, Showing Appearance of the Completed Ceiling.

FLASHINGS.

It is stated that the promoters of the co operative Sheet mill to be built at Scottsdale, Pa., have completed their plans and that work on the new plant will be begun at once. Over $140,000 is said to have been subscribed.

An inquiry was in the market this week from a large New York City export house for a quantity of Galvanized Corrugated Iron for early shipment to the British West Indies. Heretofore such shipments have been found out of the question owing to the cheaper price at which British made material could be obtained.

The Illinois Roofing & Supply Company, 203 Lake street, Chicago, believe in taking some of the medicine they prescribe for other people. They have just completed decorating their office and counting room, having among other improvements put up a very handsome Steel Ceiling. It is constructed with square panels, having deep beams forming the divisions, and is also heavily coved and friezed, altogether forming a fine sample of the work which can be done with the goods offered by this company.

David Lipton's Sons, manufacturers of Architectural Sheet Metal Work, Philadelphia, have just issued a 104-page catalogue descriptive of their line of Cornices; Bay, Oriel, Dormer or Mansard Windows; Window and Door Heads, Conductor Heads, Roof Crestings; and Finials, Ridging, Skylights and Ventilators. The book is profusely illustrated, printed on fine paper, and bound in black stiff paper covers with the firm's card embossed in silver on the front and their trade-mark on the back.

O'Gara Brothers are building a one-story brick building 16 x 75 feet at 8 Summer street, Worcester, Mass., in which they will prepare Tin for their roofing business. They are now very busily engaged with contracts for Tin and Slate Roofing.

The Foerster Company, 806 Fifth street, New York City, have been awarded the contract for the copper and tile work in connection with the new school house occupying an H-shaped plot running through from 108th to 109th street, this city, and having a frontage of 200 feet on each street. The amount of the contract exceeds $20,000.

The Struthers Iron & Steel Company, Struthers, Ohio, are now in the market as makers of Galvanized Sheets.

The Cleveland & Buffalo Transit Company have decided to build a new passenger boat duplicating the "City of Buffalo," which has been in service for the past two years. The contract has been let to the Detroit Dry Dock Company, Detroit, Mich.

TIN PLATES.

THE SHENANGO TIN PLATE COMPANY.

The Shenango Tin Plate Company of New Castle, Pa., have made application for a charter of incorporation. Among those interested in the new concern are John Stevenson and Rufus Patterson of the New Castle Wire Nail Company and W. E. Reis of the Shenango Valley Steel Company. Other capitalists of New Castle are largely identified with the new enterprise. This concern propose to erect what will undoubtedly be the largest tin plate plant ever built in this country, where there are already the largest plants in the world. It is to contain 30 hot mills, 27 cold mills, driven tandem, with all other necessary equipment, all of which will be of the most modern design. A number of Pittsburgh concerns building rolling mill and tin plate machinery have been figuring on the work for some time. Already the contract for the buildings has been let and has been placed with the Shiffler Bridge Company of Pittsburgh. All of the buildings will be of the most approved design and construction and will be steel and iron throughout. Many new features not heretofore in use in tin plate practice will be introduced in the new plant. The exact dimensions of the buildings have not as yet been determined, but the main building will be sufficiently large to accommodate 30 hot mills and 27 cold mills. The new plant will probably be erected near the present plant of the New Castle Steel & Tin Plate Company on land owned by the Phillips heirs and Luther Sample, about a mile south from the center of New Castle. The new company specify that they will take the land if the borough of Mahoning town will come into the city. Should the borough refuse to do so, then the Phillips heirs and Mr. Sample must themselves petition the courts for the admission of their property into New Castle. The reason for this, as given by the new company, is that they want police and fire protection, which they cannot get outside of the city. The contract for the rolling mill equipment is expected to be placed within the next couple of weeks and work on the construction of the plant will be pushed forward as rapidly as possible.

Report on the American Tin Plate Industry.

Col. Ira Ayer, special agent of the Treasury Department, is at present at work on his annual report on the American tin plate industry, covering the fiscal year 1896-97. It will not be ready for publication, however, for some weeks. This report will be of special interest, as it will complete the six years' probation provided for the industry under the terms of the McKinley law of 1890. It will be remembered that this act required, in substance, that during one of the six fiscal years beginning July 1, 1891, and ending June 30, 1897, the total production of tin and terne plates in the United States weighing lighter than 63 pounds per 100 square feet should, as a condition of the continuance of the duty then imposed, equal one-third the amount of such plates imported and entered for consumption in any one of the said fiscal years. Otherwise, according to the act, on and after October 1, 1897, all such plates should be admitted free of duty. How far these requirements have been not only fulfilled but exceeded by the American manufacturers is a matter of trade history. In the fiscal year ended June 30, 1896, the last for which returns of the American production have been published, the net importations of foreign tin plate were 236,000,000 pounds, while the American production exceeded 265,000,000 pounds. In the past fiscal year the increase in the domestic output over the importations was very considerably more pronounced. It is safe to say that the progress of the American industry has far exceeded the wildest expectations formed for it by the most enthusiastic upholders of the McKinley law seven years ago.

Declining Tin Plate Imports at Atlantic Ports.

The returns of imports of foreign tin and terne plates at the four principal Atlantic ports—New York, Philadelphia, Boston and Baltimore—during the nine months ended September 30, 1897, show an aggregate falling off in such entries of over 200,000 boxes as compared with the corresponding period of last year. The decline was not so marked at New York as at the other three ports named, owing to the fact that New York now, and for some time past, has received almost all the Welsh tin plate entered on the Eastern seaboard. Shipments to other points on this coast are becoming more and more infrequent. Although the comparative decline at New York has been moderate—from 907,874 boxes in 1896 to 849,476 in 1897—Philadelpha's recepts of tin plate have fallen over 50 per cent., while Baltimore's and Boston's figures this year show a decline of about 80 per cent. as compared with last year. The following table gives the receipts of tin plate in boxes at the four ports referred to for the first nine months of the four years 1894 to 1897 :

	1894.	1895.	1896.	1897.
New York	1,465,201	1,114,633	907,874	849,476
Philadelphia	199,143	147,371	46,957	23,008
Baltimore	694,585	630,608	102,352	22,195
Boston	106,194	95,039	54,766	9,342
Totals for nine months	2,465,843	1,987,651	1,111,949	904,021

American M F Plates.

The Ellwood Tin Plate Company of Ellwood City, Pa., officially advise the trade from their general office at Cleveland, Ohio, of the arrangement mentioned a short time ago in these columns as having been made with R. B. Byass & Co. of the Margam and Mansel Tin Plate Works, Port Talbot, Wales, whereby the well-known M F brand of terne plates will in future be manufactured by the Ellwood Tin Plate Company at their Ellwood City works. In the circular imparting this information the company state that they will spare no effort to maintain the present high standard of quality and will absolutely guarantee every box of plates bearing their M F trade-mark. A *fac-simile* of a letter from R. B. Byass & Co., appended to the announcement, assures the trade that the M F plates sold by the Ellwood Tin Plate Company "will be in all respects identical with the plates manufactured and sold by them in Wales for over 50 years past." Sidney H. Byass, managing partner of the Welsh firm, joins the directorate of the Ellwood Tin Plate Company, and the manufacture will be under his direct supervision. The Ellwood Tin Plate Company have secured the services of L. L. Abbott as distributing agent for the M F brand. The offices of L. L. Abbott & Co. will be at 136 Liberty street, New York City.

New Tin Plate Plants.

A number of large tin plate plants are being figured on at the present time, and it seems certain that two or three of them will be built. One of these that is being figured on is a 30-mill plant to be erected on the outskirts of New Castle, Pa. Nearly all the tin plate machinery builders in Pittsburgh are figuring on the contract, and it is probable it will be let in a short time, although the contract may not call for 30 mills at the start. A number of parties heavily interested

in the plant of the New Castle Steel & Tin Plate Company, New Castle, Pa., are reported to be prominently connected with the new enterprise. It is also a fact that some preliminary figuring has been done on a large tin plate plant at Hite Station, on the line of the West Penn Railroad, about 20 miles from Pittsburgh. This is to be an 8-mill plant at the start, and it is not improbable the contract for its construction will be let before the first of the year. It is understood that J. W. Place & Co. of New York City have awarded a contract for the erection of a 4-mill plant to be located at Johnstown, Pa. This week the Laughlin Nail Company of Wheeling, W. Va., with tin plate plant at Martin's Ferry, Ohio, placed a contract for the erection of six more hot mills with all necessary appliances, which will double their present capacity. From the above it would seem that the building of tin plate plants for the next six months or more should be quite active. A number of other tin plate enterprises are in an embryo state, and will probably not be given out until after the first of the year.

SCRAP.

The scarcity of Sheet and Tin Plate Bars is still greatly hampering the operations of the Sheet Iron and Tin Plate makers. The Steel works are experiencing an increasingly urgent call for these materials, but they remain much behind in their deliveries and seem quite unable to cope with the demand. Some of the largest Steel works are reported as making preparations to extend their Bar mill facilities. Meanwhile, the difficulty in securing their supplies of Steel is causing much delay in the delivery of Tin Plates by the mills. Were the demand for spot Plates at all heavy the situation would be an uncomfortable one for the consumers.

Commenting on the recent formation at Pittsburgh, Pa., by six manufacturing firms of the Export Iron & Steel Company, for the purpose of extending the trade in American Iron and Steel abroad, *Ryland's Iron Trade Circular* of Birmingham, England observes: "The Americans are an enterprising body of men, and, as a rule, if they take a thing in hand they do it well; it therefore behooves every Iron and Steel firm of this country to watch Mr. Yankee's movements very closely. It will, perhaps, be easier to checkmate early before he holds anything like a strong position on the board. We know well what they can do; if not we have only to look at the Tin Plate trade. In this branch they, in a very short time, built up a huge industry, driving our Welsh friends practically out of their market, and have now made their first shipment toward establishing an export trade in Tin Plates. Enterprise is a notable feature in an American trader and very much wanted in a British trader."

The Monmouthshire Steel & Tin Plate Company, Limited, of Pontymister, Monmouthshire, is the title of a company recently chartered in England, with a capital of $350,000, for the acquisition of the well-known Pontymister Steel & Tin Plate Works. The company propose to extend and develop the plant materially.

The Ætna Foundry & Machine Company, Warren, Ohio, are reported to be running full on orders for Tin Plate Machinery and Tin Mill Equipments sufficient to keep their plant busy night and day for some time to come.

To the list of Terne Plate brands manufactured by the Jas. McDonald & Sons Company, Cincinnati, Ohio, as given opposite the name of that concern in our list of American Tin Plate works of October 2, should be added the following: Cadot's Old Style, Clyde, Redipped and Reinert Redipped.

The Morton Tin Plate Company, Cambridge, Ohio, report that their three-mill plant has been in continuous operation since July 10. Another Morewood stack has just been added to their tin house equipment, making six sets in all. The new stack will be operated exclusively on high grade Charcoal Bright Tin for milk can stock and boiler plates. The company are experiencing an increasing demand for the high grade Plates, of which they make a specialty.

The *Mexican Herald* of the City of Mexico states that Luis Siliceo has applied to the Department of Encouragement of the Mexican Government for a concession to establish a Tin Plate factory in Mexico under the law of May 30, 1893, which empowered the Government to grant special franchises and exemptions to new industries. It is well known that the canning industry in Mexico has been greatly hampered by the lack of cheap Tin Plate from which to manufacture cans to put up fish, fruit, vegetables, &c., which exist in abundance in that country suitable for canning purposes.

A scheme is on foot for erecting two blast furnaces at the Tin Plate town of Llanelly, Wales. Tin Plate manufacturers are said to be interested in the project. The town has lately had added to its industries a large galvanizing plant and an extensive Tinware factory.

As a result of the depression in the Welsh Tin Plate trade and the labor troubles which are constantly cropping up there, a number of the old established works are closing down, some of them going out of the business altogether. The Dafen Works, at Llanelly, one of the oldest in the trade, and which has been recently enlarged by the addition of two new mills, is to be sold, the company having been wound up, and the plant of the Landore Tin Plate Company, at Landore, has been put out of operation permanently. A number of other works are idle, several of which are unlikely ever again to be used for Tin Plate manufacturing purposes.

The Joint Traffic Association have announced a new freight rate on Black Plate of 5 cents per 100 pounds from Connellsville to Pittsburgh, Pa.

The Totten & Hogg Iron & Steel Foundry Company, Pittsburgh, Pa., manufacturers of Rolling Mill Engines, Tin Mills and Rolling Mill Machinery, have lately closed a contract with J. W. Place & Co., bankers, of New York City, for a complete Tin Plate plant to be erected at Johnstown, Pa. The Totten & Hogg Company have the contract for the entire plant from the ground up, including the buildings, the engines, which will be their new improved Ætna Corliss Engines, Boilers, Pumps, Heaters, Mills, Shears, Furnaces, Pickling Machine, Cranes, Floor Plates, &c.

George J. Humbert, president of the Humbert Tin Plate Company, South Connellsville, Pa., was a visitor among the trade this week in New York City. Mr. Humbert is eminently satisfied with the results secured by his Tin Plate works, which have been running along steadily with all four mills for several months past, turning out a fine quality of product. He describes the new town of South Connellsville, which is practically the creation of his own energy and perseverance, as a model manufacturing town surpassed in point of railway communications and proximity to the sources of supply for raw material and fuel by few other places. The lack of sufficient housing accommodation for the workers employed in the various industrial enterprises which have located at South Connellsville is at present the only drawback. This, however, will be obviated before long, as arrangements are being made for the erection of a large number of new dwelling houses.

The residents of Port Angeles, Wash., are very confident that the plans of William Price of McKeesport, Pa., will be carried out and that they will shortly have a full fledged iron and steel plant, including blast furnaces, open hearth steel works and tin plate factory. This is the plant in which workingmen are reported to be anxious to invest their savings. In an interview with a reporter for a local journal Mr. Price is made to say that "now we have much more capital than we need."

F. A. Bancroft, formerly with Casey & Day, Chicago, has been appointed assistant sales agent for the National Tin Plate Company, Anderson, Ind. The company have been manufacturing Coke Tin Plates exclusively, but are now engaging in the production of Charcoal grades in addition.

The sales offices of the American Tin Plate Company, including that of W. B. Leeds, president; Jno. F. Hazen, vice-president, and D. G. Reid, treasurer, have been removed to 1118 Marquette Building, from Indianapolis, Ind.

A New Illuminating Gas.

The name of Eureka gas is given to a new illuminant originated by Hector de Favi of Montefiascone, Italy, which is expected to rival acetylene. According to *Invention* of London it is obtained as follows: Lime, as pure as possible, is employed as a base, colophony and calcium carbide being added—1000 parts of the mixture ready for use consisting of 900 of quicklime, 50 of colophony and 50 of calcium carbide—and there is said to be no liability of explosion by mixing with air; no heating of water and no special burner is needed. One thousand parts of the mixture give 60 liters of gas at a pressure of 35 mm. of water: and the photometric intensity of the flame is stated to be 92.4 candle hours, while the same amount of calcium carbide employed singly would give only 18 candle hours. Thus, it is asserted, the new gas is 50 per cent. cheaper than acetylene, or that at equal cost it will give half as much more light.

THE RETAIL STORE.

North Dakota Retail Hardware Association.

A meeting of North Dakota retailers was held in Grand Forks on Wednesday last, 29th ult., for the purpose of forming a State organization. Nearly 50 per cent. of the dealers in the State were present in person or represented by proxy. The call for the meeting was read by C. N. Barnes of Grand Forks, to whom is due much of the credit for the organization which followed. Clark W. Kelly of Devil's Lake was chosen temporary president, and George A. McCrea of Drayton, temporary secretary. The president then proceeded to state the object of the meeting, and called upon J. E. O'Brien of Crookston, Minn., a member of the Executive Board of the Minnesota Hardware Dealers' Association. Mr. O'Brien's remarks were listened to with much interest. He said :

MR. O'BRIEN'S ADDRESS.

Owing to the many matters that have commanded my attention in the past few weeks, I come before you, I may say, wholly unprepared to discuss the subject that you meet here to-day to consider, representing what I am pleased to call your 'brothers from Minnesota' in this great movement to better trade conditions, and on behalf of our president and the members of our organization to welcome you into our brotherhood, and bid you God speed in your efforts directed against placing the vast retail business interests of our country in the hands of a few, there to be controlled and manipulated in years to come by trusts and combinations that the few can form to the detriment of the masses. It is not impossible, should present trade conditions exist, to see the retail Hardware business worthy of mention of your great State placed in the hands of a few men—three or four located under three or four roofs, in possibly two cities—and should that condition be brought about what will become of the now convenient market place for the great mass of your people that are engaged in agriculture ? Will they be compelled to flag a train when they want to send their produce to market ?

What will become of your beautiful cities, towns and villages that dot your fertile prairies ; that to-day are used to a great extent in measuring and determining the value of the farm lands that surround them ? Will their business blocks become tenantless and taxless ? What will become of the great army of trustworthy and capable young men who are acting in the capacity of our confidential clerks, for we find that nearly every person we employ must be qualified to fill that important position many times during the year, and they command a salary measured by their honesty, integrity and ability that will furnish them a comfortable living for themselves and their families. Will they have to give way to persons who require the constant care and watchfulness of an overseer, and this oftentimes at an age when they should be receiving an education, and who rarely ever rise above the position they occupy, and whose situation is always for sale to the lowest bidder, because it can be filled at any moment by almost any person ?

What will become of your farmer who has to ask his merchant for credit from spring to fall ? Will he be compelled to give up his home, and he and his family work like slaves for some capitalist at low wages all their lives ?

No, my friends, this centralization of the vast retail business interests of this country must not continue The Minnesota retail Hardwaremen have spoken in plain and no uncertain tone, and the force of their arguments is felt at every trade center in the United States, and re echoes back with a cheerful submission to the will of our organization.

Organization is mighty, but it must be complete. It must embrace every person interested in its success. Petty jealousies must not interfere with this plain duty that we owe ourselves, our families and our country ; but united we should stand for fair and reasonable principles that should govern our organization. We are not monopolists ; we are anti-monopolists. We aim to increase the number of dealers in our line of trade rather than decrease them. Where trade is concentrated in the hands of a few, there monopoly has its birth. Where it is placed in the hands of the many, monopoly is unknown.

The principles for which we contend mean the upbuilding of your cities, villages and towns. If we fail, a few dealers in large cities will control mercantile trade in all its branches, crushing out all rivalry in your State, and erecting the despotism of their monopoly to the great detriment of your people.

In conclusion, I wish to say again that the Minnesota Retail Hardware Dealers' Association welcomes your organized effort, and will be in full accord with you in the enforcement of your resolutions, and ask of you that you give your support toward the organization of States now organized into a national organization, for it is on the successful consummation of national unity that the success of this movement largely depends.

The jobbers who were present were also called upon for an expression of opinion as to the advisability of forming such an organization. T. G. Walthers of the C. W. Hackett Hardware Company of St. Paul gave his opinion from the standpoint of a jobber, and stated that the interests of the retailers and jobbers were identical, and that they would be pleased to give all the assistance in their power to aid in forming the desired organization in the State of North Dakota. A. M. Marshall of the Marshall-Wells Hardware Company of Duluth also indorsed the movement and urged the formation of an organization for the mutual benefit of both retailers and jobbers.

Addresses were made by other dealers present, and letters from some of the dealers who were unable to attend were read. The general opinion was that an organization should be formed at this meeting. A vote was taken on the proposition to organize, and every dealer present voted in favor of it. The chairman then appointed the following committees : Resolutions and By-laws : H. N. Joy, Hamilton ; C. N Barnes, Grand Forks ; H. F. Strehlow, Casselton ; W. H. Pinkerton, Lakota, and W. R. McIntosh, Bottineau. Permanent Organization : P. L. Pritchard, Hillsboro ; J. F. Newgaard, Grafton, and A. H. Duntley Grandin.

A recess was then taken until afternoon to allow the committees time to make a report. At the afternoon session the Committee on Permanent Organization made the following report through P. L. Pritchard, the chairman of the committee :

1. We recommend a permanent organization. 2. The organization shall be known as the North Dakota Retail Hardware Association. 3. We recommend as president, Clark W. Kelly of Devil's Lake ; vice-president, C. F. Jacobs of Hillsboro ; treasurer, George A. McCrea of Drayton ; secretary, C. N. Barnes of Grand Forks.

On motion the report of the committee was accepted, and the officers thus nominated were declared elected. The Committee on Constitution and By-laws then made a report. The by laws were read section by section, and were adopted by unanimous vote.

On motion, the president, vice-president and secretary made the following selection of an Executive Board : H N. Joy, Hamilton ; H. F. Strehlow, Casselton ; W. H. Pinkerton, Lakota ; J. F. Newgaard, Grafton ; J. C. Le Beau, Grand Forks ; A. H. Duntley, Grandin, and A. J. Smith, Fessenden.

The following resolutions were introduced by H. N. Joy and were unanimously adopted :

Resolved, That the thanks of this association be and are hereby tendered to C. N. Barnes for his work in bringing about this organization, and that he be reimbursed by the association for monies expended for postage, printing, etc.

Resolved, That the thanks of this association be extended to J. E. O'Brien of Crookston, Minn., for his attendance at the meeting, and for his valuable advice and assistance.

The organization being completed a motion to adjourn

was carried, and the next meeting will be held the third Wednesday in February in this city.

During the evening some of the members held another meeting for the purpose of discussing matters in connection with the oil trade, and those who handled this staple article expressed themselves very forcibly on the subject of the Standard Oil Company furnishing oil to the supply houses, who in turn sold it at a much less price than could be done by the average retailers. President Kelly will appoint a Committee on Organization, which will be made up of one dealer from each county, whose duty it will be to secure the membership of each dealer.

THE RESOLUTIONS OF THE ASSOCIATION.

Resolved, That the members of this association confine the purchase of Hardware, Stoves and Tinware to manufacturers and wholesale dealers who sell goods only to firms that are regularly engaged in the retail Hardware business as defined in these resolutions.

Resolved, That it is the sense of the convention that the interpretation of the term "retail Hardware dealer" as set forth in the above resolution, to entitle him to purchase Hardware, Stoves and Tinware, be construed to mean any persons having an established place of business and carying a line of Hardware, Stoves and Tinware, and such goods as are usually kept in a first class Hardware store.

Resolved, Any manufacturer or jobber soliciting orders or selling goods in any town or city where a member of the North Dakota Retail Hardware Association is located and doing business, except it be to an exclusive Hardware dealer in such town or city, shall be considered as working against the interests of said association; provided that nothing in this article shall be so construed as to prevent manufacturers or jobbers from selling to manufacturers in any city or town goods actually used in articles manufactured by them, nor from selling to railroad or transportation companies. The interpretation of this resolution is hereby vested in the Executive Committee.

Resolved, That any manufacturer or jobber in Hardware, Stoves or Tinware furnishing net prices or any discount from list prices contrary to the foregoing resolutions, either by themselves, employees or agents, shall be considered as disapproving the above resolutions.

Resolved, That this association shall, as far as lies in its power, keep a record of all goods sold, and by whom sold, to catalogue houses and department stores, and of all other violations of these resolutions.

Resolved, That any member purchasing goods from any manufacturer or jobber who has been listed by the Executive Committee as disapproving of these resolutions, shall be subject to fine or expulsion, at the discretion of the Executive Committee.

Resolved, That every member of this association is constituted a committee of one, and is expected to report to the proper officers in this State any violation of these resolutions.

Resolved, That these measures are just and necessary for our welfare and a rigid enforcement is demanded.

Resolved, That this convention indorses the above and urges its officers to use their best efforts to bring about the formation of a national association with the end in view that a uniform system of protection for the trade will prevail throughout the entire country.

The American Burner.

American Brass & Lamp Company, 44 Park place, New York, are using in this season's lamps what they call the 1897 American burner. This burner has a positive movement, the wick being raised or lowered by turning a screw, which by means of cast brass gears operates several other cogs which attack the central draft wick in different places. The device is very simple, not likely to get out of order and is very efficient, there being no jerky motion. The company have also enlarged their assortment of lamps by adding to those brought out earlier in the season two distinct shapes in reception lamps. These have vases mounted on metal bases, the vases being something like 10 to 12 inches in diameter and 5 or 6 inches high. The lamps are fitted with porcelain globes, both vase and globe being handsomely decorated in great variety. There are also two distinct shapes somewhat similar in character to those described above, but without metal bases, smaller in size, fitted with ordinary flat wick burners and sold at much lower prices.

One of the most attractive among the exhibits in the American Institute Fair, now open at the Madison Square Garden, New York City, is that of the Hill Whitney Aluminum Company of Boston, Mass. The company's booth is located on the first tier above the main floor and is easily recognized by the glitter of the fine array of Aluminum Ware with which it is furnished. Examples of all the articles included in the long line of H. & W. Cooking Utensils and Household Ware made by the firm are tastefully displayed, and the merits of aluminum ware are convincingly interpreted to the public by the courteous attendants. Particular attention is called to the company's new Victor Broiler and Frying Pan in aluminum, and to Hill's Champion Steam Cooker, which attract a large share of attention.

Aluminum Pepper Shaker.

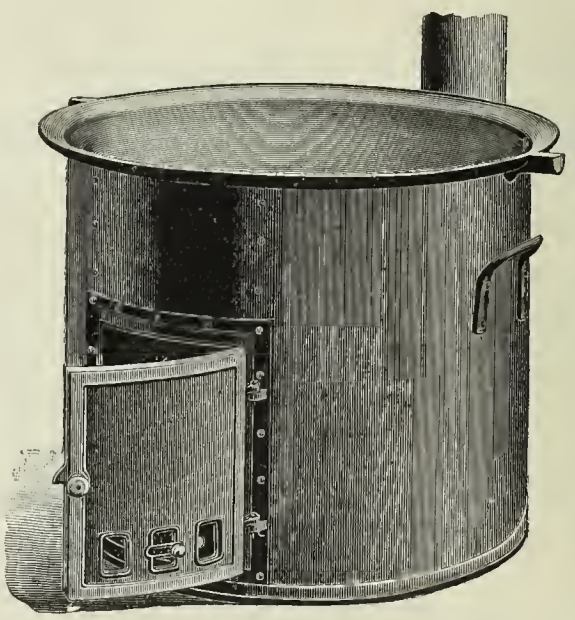
Among the new goods gotten out this season by the Griswold Mfg. Company, Erie, Pa., is the aluminum pepper shaker shown in the accompanying illustration.

Aluminum Pepper Shaker.

These articles are finished in a high polish, except the lower fluted part, which is left in satin finish. The shakers are made with two sizes of holes, adapted for pepper and salt. They are of exceedingly neat and attractive appearance.

Boiler and Feed Cooker.

A boiler which is adapted for use in a variety of ways, but is specially valuable on the farm for preparing feed for the stock, has been brought out by the Wagner Mfg. Company, Sidney, Ohio. This feed cooker is so constructed as to give, it is claimed, very good results with a small consumption of fuel. The kettle is of smooth cast iron and can be instantly removed from the casing, which is of strong cold rolled steel, supported at the bottom by a heavy wrought iron band. Inside of the casing is placed a cast iron flue which carries the products of combustion up and around the kettle before they pass into the smoke pipe. This, the manufacturers claim, brings the entire outside of the kettle in direct contact with the fire, and allows 50 gallons of water to be boiled in a period ranging from 20 to 25 minutes. Legs are dispensed with in order to bring the kettle low down for convenience in use, the entire hight being only 30 inches. A general view of the boiler and feed cooker is presented in the accompanying illustration. The jacket to the furnace is in one continuous sheet of steel, and thus there are no joints

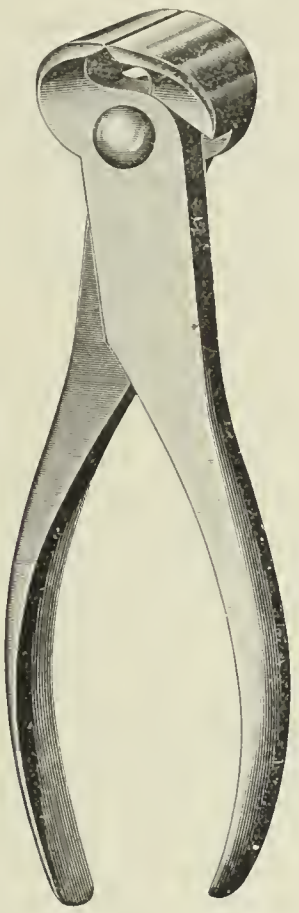


Boiler and Feed Cooker.

to open and take in air. The device is made in three sizes, with capacities of 35, 55 and 60 gallons respectively. The manufacturers state that no foundation is needed for the cooker when it is set on the ground, but when it is to be used on a wood floor it is necessary to make a foundation of 2 inches of ashes, covered with a layer of brick. This may be incased or held in place by four pieces of 2 x 4 scantling about 3 feet long, nailed together at the corners.

End Cutting Nipper No. 60.

Utica Drop Forge & Tool Company, Utica, N. Y., J. C. McCarty & Co., 10 Warren street, New York, selling agents, are putting on the market the end cutting nipper

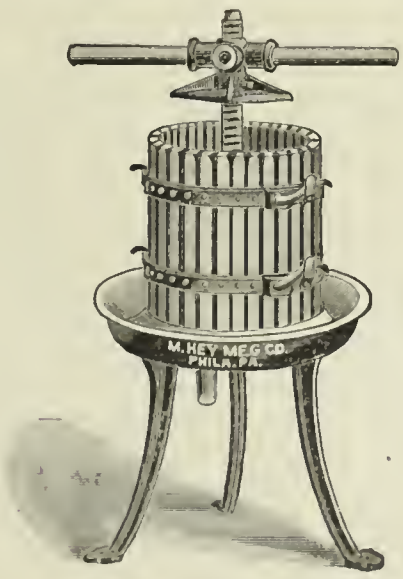


End Cutting Nipper No. 60.

shown herewith. It is described as having a strong and powerful rivet, giving great durability to the tool, and as being so constructed as to cut very easily. The handles are referred to as being very easy for the hand, and the nipper as being extremely useful in cutting hard and heavy wire. It is made in five sizes, running from 5 to 8 inches, and is furnished in both bright and black finish.

Wine or Fruit Press.

M. Hey Mfg. Company, 633-637 North Third street, Philadelphia, Pa., are putting on the market the wine or

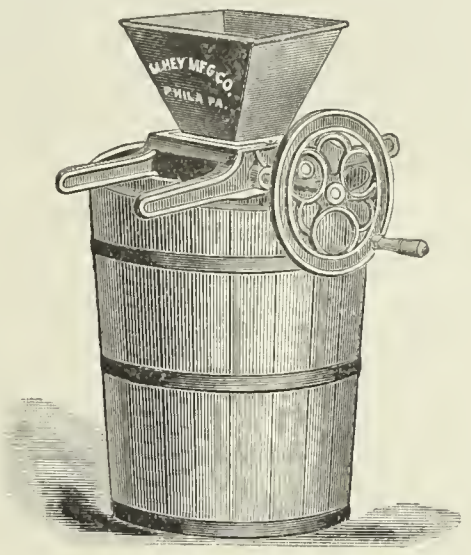


Wine or Fruit Press

fruit press here shown. The screw or spindle of the press runs up through the iron bowl and works on the principle of a bolt. This, it is claimed, obviates the liability to bend the spindle. The cylinder is of wood in lattice form and is made in halves and can be easily and quickly taken apart by simply loosening the four levers shown in the cut. The iron bowl, is lined with white enamel paint. The press is made in three sizes with cylinders 10, 12 and 20 inches in diameter, and 12, 14 and 18 inches high. The smallest size has a cylinder with malleable iron loose pin hinges as fastenings instead of levers.

Grape Mill.

The engraving herewith shows the grape mill which the M. Hey Mfg. Company, 633-637 North Third Street, Philadelphia, Pa., are bringing out. The device is made entirely of iron and is designed for use over any tub or barrel. The grinding parts consist of two grooved rollers, each 4 inches in diameter and 6½ inches long, geared at



Grape Mill.

the back of the hopper and operated by a handle wheel. The hopper is painted on the inside with white enamel and the crushing rolls are coated with shellac varnish so that the juice does not come in contact with the iron. The mill is made in one size only.

Aluminum Griddles and Roaster.

In Fig. 1 is illustrated an aluminum griddle which is manufactured by the Illinois Pure Aluminum Company, Lemont, Ill. From experience with these griddles, the fact has been demonstrated that they require no grease.

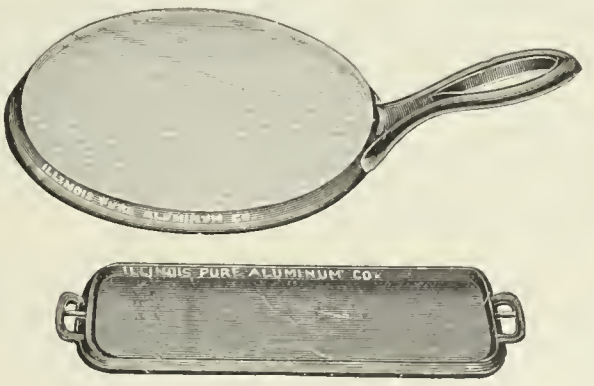


Fig. 1.—Aluminum Griddles.

The metal itself being of a greasy substance will be sufficient to cook ordinary cakes without the usual coating of lard each time the batter is placed upon the griddle. All that is necessary is to wipe these utensils with a greasy

Fig. 2 —Aluminum Roasting Pan.

rag when they first become hot. They are made both round and oblong. The round ones are furnished in four sizes, 9 to 16 inches, and the oblong in two sizes, 16½ and 19½ inches. The company are also putting on the market the aluminum roaster, which is illustrated in Fig. 2.

The roasters are referred to in complimentary terms by those who have had experience with them. The metal is a rapid conductor of heat, and it is claimed that its heat retaining qualities make them superior to ordinary sheet metal roasters. Four sizes are made, ranging from 12 to 16 inches.

MEMORANDA.

The Hill-Whitney Aluminum Company, 90 Canal street, Boston, Mass., issue a new catalogue and price-list in the form of a three-page illustrated folder relating to the H. & W. Aluminum Cooking Utensils and Household Ware, covering over 30 different kinds of articles some of which are made in six or seven sizes. The goods illustrated include Saucepans, Windsor Kettles, Preserving Kettles, Double Boilers, Tea Kettles, Baking and Pudding Pans, Chafing Dishes. Pie Plates, Covered Broilers, Frying Pans, Ladles, Funnels, Cuspidors, Trays, Drinking Cups, &c. as well as Hill's Champion Steam Cooker and the Matchless Coffee Pot, which are patented specialties. The Hill-Whitney Aluminum Company have a branch store at 106 East Twenty-eighth street, New York City.

George G. Spencer, 165 Jackson street, Chicago, has purchased and will operate the entire plant, including the plating works, of the Illinois Handle Bar Company. This addition to his other lines gives him a far more varied product, so that he is now prepared to furnish all styles of Seamless Steel Handle Bars, Rear Forks, Rear Stays of round or D shape, either bent or plain, Fork Sides, Seat Posts, Stems. Frames. Hubs, Pedals, Wrenches or Cold Drawn Seamless Steel Tubing in any reasonable length. Mr. Spencer has just issued an illustrated sheet which shows 14 different styles of Handle Bars, but by no meaus exhausts the patterns he is prepared to furnish. He is pushing the Bicycle Supply business with the same vigor that characterized him during the palmy days of the Cut Nail, when he was such an important factor in the Nail trade.

L. Weaver & Co. have succeeded the Estate of A. F. Sellars in the wholesale and retail Hardware, Stove, Tinware and Sporting Goods business at Hico, Texas. They state that they would be pleased to have manufacturers in their lines favor them with catalogues, prices, &c.

Mitchell, Powers & Co., Bristol, Tenn, who are wholesale dealers in Hardware, Agricultural Implements, Stoves, Tinware, Sash, Doors, Blinds, Buggies, Wagons, &c., have issued a 30-page Stove catalogue which gives an idea of the line of these goods which they are handling. It also calls attention to Feed Cutters, Corn Shellers, Axes, Plows, Roofing, &c.

T. A. Riddle, Johnson, Vt., who has been engaged in the Stove and Tin business at that point for tho past 25 years, has recently moved into a new store, and has added a complete stock of Hardware to his other lines. The business will hereafter be conducted under the style of Riddle Bros. In arranging the shelving, sample boxes, counters, showcases, &c., in the new store. Mr. Riddle states that he has adopted many of the methods illustrated in "The American Hardware Store," believing them to be practical and convenient.

A new firm at Gowrie, Iowa, is the Nelson Hardware Company, consisting of J. F. Nelson, who is interested in the Prusia Hardware Company of Fort Dodge, and Elmer Nelson of Gowrie. They will do a retail business in Shelf and Heavy Hardware, Stoves, Tinware, Sporting Goods, &c.

Manchester Hardware Company is the title of a new firm who opened up September 1 at 4245 Manchester avenue, St. Louis, Mo. The company are carrying a $5000 stock of general Harware, Stoves, House Furnishings, Paints, Oils, &c. They are anticipating a good trade with the development of the southwestern part of the city, in which they are located. A. L. Fallon, manager of the business, has had a long experience in the Hardware business, having been connected with the Simmons Hardware Company and A. F. Shapleigh Hardware Company for the past 13 years, and prior to that time for a number of years in the Hardware line at Mercersburg, Pa.

The Dowd Hardware Company have opened up at 31 Pine street, Muskegon, Mich., with a wholesale and retail stock of Hardware, Stoves, Tinware and Agricultural Implements. They are doing business on a cash basis, and refer to trade as quite good.

C. H. Collins & Co. have opened up in the Hardware business at Le Sueur Center, Minn. They have a new store, and are carrying a stock comprising Shelf Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods and Furnaces.

The Marshman Hardware stock, in Montpelier, Ohio, has been purchased by Warren Miller and A. E. Lamberson, who have opened up under the style of Miller & Lamberson. The new firm will increase the stock thus bought with a view to making it complete in the Hardware, House Furnishing, Stove and Tinware lines.

Tucson Hardware Company, Tucson, Ariz., have taken possession of their new store, which they refer to as a very fine one. They state that they have only one counter in the store, a Nail counter. All their wrapping is done on wide ledges in connection with shelving. Instead of drawers on Hardware side of the store they have shelves inclosed by doors, with samples on the outside. All fixtures are finished in natural color of wood. The company wholesale as well as retail, handling Hardware, both Shelf and Heavy, Tinware, Stoves, Implements, Sporting Goods, &c. They discount all their bills.

Aluminum in Structural Work.*

In the use of aluminum for structural purposes the selection of the proper grade that should be used will depend largely upon the specific purpose to which it is desired to apply the metal, but generally speaking, for purposes where aluminum is brought into tension, such as in sheets, or in rolled shapes (as angles, beams, &c.), an ultimate tensile strength of from 32,000 to 40,000 pounds per square inch may be reckoned upon, and a safety factor of 4 gives an allowable working strain of from 8000 to 10,000 pounds. This, of course, is not for pure metal, but for the stronger alloys.

The ultimate tensile strength of pure metal in plates and shapes may be taken at from 24,000 to 28,000 pounds, and with the same safety factor of 4 it gives an allowable working strain of from 6000 to 7000 pounds. For the alloys of cast aluminum in tension, the ultimate strength may be taken at from 18,000 to 28,000 pounds per square inch; using a safety factor here of 5, as aluminum castings are quite uniform and solid, a working strain is obtained of from 3600 to 5600 pounds per square inch. It is difficult to give a value for the ultimate strength of pure cast aluminum in tension, for the reason that while the ordinary pure aluminum will average about 16,000 pounds per square inch, this can be increased very considerably by cold working, and in some cases to as much as 24,000 pounds per square inch. Assuming the average strength and using a safety factor of 4 gives an allowable working strain of from 3200 to 4800 pounds.

In comparison, the alloys of aluminum in rolled plates and structural shapes, such as struts, columns, &c., have an ultimate tensile strength of from 26,000 to 34,000 pounds per square inch, which, using a safety factor of 4, gives an allowable working strain of from 6500 to 8500 pounds per square inch. Pure aluminum sheets and structural shapes in compression have an ultimate tensile strength of from 20,000 to 24,000 pounds per square inch, which with a safety factor of 4 gives an allowable working strain of from 5000 to 6000 pounds per square inch.

Castings of aluminum in comparison can be taken at 16,000 pounds per square inch for pure aluminum and from this to 24,000 pounds per square inch for the alloys. Using again a safety factor of 5 an allowable working strain is given of from 3200 to 4600 pounds per square inch. But the pure metal should not be used in castings, except for electrical purposes, as it resembles pure copper in being difficult to cast and is soft, comparatively weak and has a large shrinkage. In its stead for most casting purposes alloys with from 5 to 20 per cent. of copper, nickel or other hardeners should be used.

The alloys of aluminum in rivets and similar shapes in shear have an ultimate shearing strength of from 24,000 to 27,000 pounds, which, using here a safety factor of 6, gives an allowable working strain of from 4000 to 4500 pounds per square inch. The ratios of the ultimate shearing strength to the ultimate tensile strength for double riveted joints is about 60 per cent., and for single riveted joints the ratio is about 70 per cent. The ratio for steel is about 75 per cent. In bearing, the ultimate value of the alloys of aluminum is from 32,000 to 40,000 pounds per square inch, which, using a safety factor of 4, gives an allowable working strain of from 8000 to 10,000 pounds.

The attention of those contemplating the use of aluminum for structural purposes is called to the fact that the elastic limit is closer to the ultimate tensile strength than in any other of the commercial metals, and for this reason the safety factor of 4 or 5 means a great deal more than it does in steel or iron, where the same safety factor is used. Where any great strength in aluminum is desired, the metal should be protected in such a way that its temperature will not be raised very much beyond that of the ordinary atmospheric temperature, for the reason that aluminum melts at a little less than 1200 degrees F.

The values given above are for temperatures of less than 100 degrees C. (212 degrees F.); for temperatures between 100 degrees and 200 degrees C., the unit strain should be decreased by 50 per cent. and above 200 degrees aluminum should not be designed to be used iu strain.

* From a lecture before the Franklin Institute of Philadelphia, by President Alfred E. Hunt of the Pittsburgh Reduction Company.

Watt and the Measurement of Power.

The following, being the "Watt Anniversary Lecture," was delivered recently at Greenock by William Henry Preece, Engineer-in-Chief and Electrician, General Post Office, London :

The Indicator.

James Watt, who died 77 years ago, was a great inventor. He was "one of the most illustrious followers of science, and one of the greatest benefactors of the world." If he had never improved the fire engine of his, the steam engine of our day, the copying press alone would have maintained his name on the scroll of inventive fame. His greatest invention, that which has been most prolific in exciting further improvements in the steam engine, and which has supplied the engineer with a new sense, is perhaps the indicator. The indicator enables an engine itself to record automatically on paper a diagram which, properly interpreted at leisure, conveys a clear history of the performance of the steam in the cylinder. It enables the engineer to measure the actual work that is being done by it, and it gives a report of the action of the valves and parts which control the ingress and egress of that steam, and which regulate the performance of the machine. It gives an insight into the internal actions of the machine, which, being out of the range of direct observation, are so liable to be misinterpreted. It is to the engineer what the stethoscope and the thermometer are to the physician.

Accuracy in measurement is the foundation of engineering and the secret of practical success. It leads to the detection of error, and to perfection in working. No instrument has been more productive of improvement in this respect than Watt's indicator, and few instruments have been found to require less modification. The conception and development of this apparatus showed that Watt was a long way before his time in grasping the doctrine of energy and applying the practice of graphics. With such an extensive literature on the subject, and with its universal employment by engineers, it is unnecessary to describe the instrument. I content myself by showing you side by side Watt's original instrument—kindly lent by Mr. Tangye of Birmingham—112 years old, and the most recent form designed to meet the requirements of modern machinery. In his patent of 1782, describing his application of the principle of expansion to the economical working of the steam engine, Watt drew a diagram, showing how much he was before his time in the use of graphics and in the conception of the principle of energy. It is quite clear that this mode of looking at the work done in the cylinder led him to consider its automatic record. It was only necessary to know the length of stroke, and to indicate the pressure of the steam upon the piston exerted during each instant of its movement, to obtain the factors of the work done during each stroke. A curve is thus formed by a pencil on a sheet of paper which by its shape gives the whole history of the performance of the engine. The area of the curve, although it contains nearly all we want, is not that which we require to know so much as its mean hight. The horizontal length gives the time of one stroke. The mean hight gives the average pressure exerted during the stroke. We thus learn the work done per stroke, and by multiplying this amount by the number of strokes per minute, and knowing the dimensions of the machine, we obtain the total work done per minute.

The Foot Pound.

The principle of work lies at the very root of the profession of the engineer ; Watt gave us not only the means to measure it, but a system to indicate it. Work done means resistance overcome. It means the application of force through space against this resistance. In Great Britain we employ as our practical unit the force or weight of 1 pound. Our space is measured in feet. Thus if we raise 1 pound 1 foot high against the resistance of gravity, we do an amount of work which we moderns call a foot pound, though Watt did not. The foot pound conveys to them who habitually use it the conception of a reality as distinct as 1 pound of butter. The engineer, like Shakespeare's poet, gives to airy nothing not only a local habitation and a name, but a concrete existence. The French unit of work is larger. It is a kilogram raised 1 m. against gravity, and is called the kilogrammeter. The kilogrammeter contains 7.23 foot pounds.

I have had some difficulty in tracing the parentage of the term foot pound. It came into existence in the forties. Joule, in his earlier papers, spoke of the work done by 1 pound acting through 1 foot. Lord Kelvin writes me, "I believe we had foot pound first from Lewis Gordon, the first professor of engineering in Glasgow University, 1844, the first really of the United Kingdom. We used it thoroughly in Glasgow when I came from Cambridge to be his colleague in 1846. Joule was most pleased to use it; I believe, in fact almost remember, that he got it from me." The English engineer is forced to use the pound weight as his unit of force, not because he is wedded to it, but because the pound and yard are the legal units prescribed by the Legislature. When Parliament thinks fit to introduce a decimal and metrical system the change of units will be easily effected, and we shall experience the inestimable advantage of having one absolute system of measurement employed alike, not only by science and by practice at home, but universally by all European nations. It is not generally known that James Watt proposed, in 1783, a new and decimal system of weights and measures. His unit length was based on the seconds pendulum. His unit weight was to be the unit cube filled with water, and he proposed to weigh all liquids and gases in terms of this unit, in order to express by the same figure specific and absolute weights. There is reason to believe that these ideas were instrumental in framing the splendid system finally made legal in France, in 1801, for Watt himself visited Paris in 1786 and was in intercourse with Laplace, Monge, and other members of the Committee of the Academy dealing with the question. Nothing can prevent this system, probably the child of Watt, from ultimately becoming universal all over the civilized globe.

Origin of the Horse-Power.

Now Watt in introducing the steam engine found the chief competitor he had to meet was the horse. It worked the pumps in mines and brew houses. It drew the ores to the surface. It was employed for grinding and for milling. It was clear that his customers would compare the performances of his engines with that of their horses. He determined by experiment that a good horse, working continuously, could raise 22,000 pounds 1 foot high in one minute. He though he would go one better ; so he said, "I will call 33,000 pounds raised 1 foot high in one minute a horse's power." Thus he gave his customers the advantage of 50 per cent. more work ; but he did more, instead of compelling them to keep relays of horses, each of which could not work continuously more than six or eight hours, he gave them a machine which worked continuously throughout the 24 hours. He showed moreover that, in Whitbread's brew house, his engine "does the work for which 30 strong horses were kept, and consumed 8-10 bushel of coals per hour."

The above definition of a horse's power was singularly unfortunate. It means 15 tons moved at a snail's pace. Few people can grasp the conception. We know what a man can do, especially when rowing a race or when raising bricks. Going up a mountain at the rate of 1000 feet per hour, a fair performance, he does about 1-12 of a horse's power—horse-power—if he weighs 12 stone. Working a treadmill absorbs ⅛ horse-power, which is distinctly hard labor. If he runs upstairs at the rate of 3¼ feet per second he does 1 horse-power, and this is not good for his heart. We also know what a horse can do in drawing a cart or moving a canal barge. Five hundred and fifty pounds moved 1 foot per second—the leisurely pace of a child walking—is more comprehensible than, and the same thing as, 33,000 foot pounds per minute, and is now more frequently used, especially abroad.

But Watt was not the first to use the term horse's power. Savery did this in 1702. "An engine," said Savery, "which will raise as much water as two horses, working together at one time in such a work, can do, and for which there must be constantly kept 10 or 12 horses for doing the same, then I say such an engine will do the work or labor of 10 or 12 horses." Watt, however, gave the unit a scientific character and was virtually its founder. He thus introduced the conception of power as the rate of doing work. His unit of work was 1 pound raised 1 foot high, irrespective of the time in which it was done ; but by conceiving this being done in a unit of time he conveyed the idea of power, a scientific definition of a much abused term. Boulton said at court to George III.: "I am engaged, your majesty, in the production of a commodity which is the desire of kings." "And what is that —what is that ?" asked the King. "Power, your majesty."

Again he was anticipated, for Smeaton in the "Philosophical Transactions" for 1759, in describing his experimental inquiry concerning the natural powers of water and wind, said, "The raising of a weight relative to the hight to which it can be raised in a given time is the most proper measure of power." Watt did, however, introduce the term duty to determine the comparative merits of steam engines. It was introduced by him in Cornwall, and is often known as the Cornish million, for he determined how many pounds could be raised 1 foot high by burning a bushel of coal in his boiler, and found that this could be expressed only in millions. Watt's bushel was subsequently changed in this country to 1 hundredweight (112 pounds), and in the United States to 100 pounds. It has now become practically obsolete, for more effective and more uniform means are adopted to express the relative efficiency of engines.

Five Kinds of Horse-Power.

The term horse-power has probably seen its best days. It is gradually being displaced, and with the advent of the metrical system it will disappear. As a scientific term it has been much abused, and as a commercial term it con-

veys no meaning. Sir Frederick Bramwell wrote in 1883 : "A barrister lately said to the same writer of this report, 'You surely do not mean to tell me that you do not know what a horse-power is, you that have been a mechanical engineer all your life?' The answer given was, 'Indeed, I do not, there is a difficulty in the outset; what sort of horse-power do you mean?' 'Why I mean a horse-power.' 'I know you do, but there are five kinds of horse-power.' 'Five kinds! impossible, it can't be?' 'But there are; I will give you the names and the nature of them : 1. The real horse-power, the power of a horse estimated to lift 22,000 pounds one foot high per minute. 2. That which in James Watt's time was called the nominal horse-power, a horse-power of 33,000 pounds, raised 1 foot high per minute which power he gave all his early engines, so that the purchaser having one and a half times the power of a good horse, should not be in a position to complain of the engine as inadequate. This term nominal is now commonly confounded with the commercial horse-power, and the name theoretical horse-power is substituted to represent that which was received as the scientific horse-power of 33,000 foot pounds. 3. The gross indicated horse-power. This is the whole power developed on the piston of the engine without any deduction for friction, which power, divided by 33,000, gives the gross indicated horse-power. 4. The net indicated horse-power. This is the same as the foregoing, minus a certain allowance for friction. 5. The commercial, or, as it is now frequently called, the nominal horse-power. This is a horse-power about which no two persons can agree.'" Sir Fredrick Bramwell might have added a sixth—viz., electrical horse-power, that which appears in the circuit, or electrical energy.

Is a horse-power really a horse's power Tredgold made it 27,000 foot pounds per minute for eight hours. Rennie assumed 22,000 as correct. Beardmore had a horse weighing a little over ½ ton which did 39,000 foot pounds per minute for eight hours a day. Morin made it 26,150 foot pounds. Two horses will tow a canal boat at 2½ miles an hour, while a steam engine of 10 horse-power is needed to do the same work by means of a screw. Tram cars are drawn by two horses at a speed which the so-called 25 horse-power motor can scarcely do. The horse is really a more efficient machine for a time than the engine and its pull can be directly applied, but he tires and sickens and dies. He is better adapted to certain kinds of work. He can at times expend much more energy than the so called horse-power. At other times he is helpless and hopeless. Thus it appears clear than a horse-power is not a horse's power. The horse-power is based, as I have pointed out, on the British units—pounds, feet, and minutes.

The Present System of Units.

Scientific men are now universally using a system of units based on centimeter, gram and second—hence called the C. G. S. system, to distinguish it from the F. P. S. or British engineers' system. In this system, the unit of work—viz., 1 gram moved through 1 cm. against unit force, is very small, but 10,000,000 of these small units are taken and are called in honor of our great British experimenter, the "joule" and become a practical unit of work. Thus Joule's own mechanical equivalent, the work absorbed in raising the temperature of 1 pound of water 1 degree F. at or about its maximum density, indicated in the F. P. S. system as 778 foot pounds, is in the C. G. S. system the work absorbed in raising the temperature of 1 gram of water 1 degree C. at or about the same maximum density as 4.2 joules. Thus the joule is to the foot pound as 1 to 1.356 and the horse-power, instead of being 550 foot pounds per second, becomes 746 joules per second. The joule per second, or the unit of power, has now been universally called a watt ; and thus in the new system the rate of doing work—that is, the power developed by the steam engine, or any other machine, or by any other process, mechanical or physical—is most appropriately indicated in units bearing the name of our great Greenock inventor. The term watt was applied in 1883 by the late Sir William Siemens to the joule per second, but I had previously, in 1881, at the Paris Congress, proposed to apply it to 1000 joules per second. Siemens' proposal has been preferred, and in consequence the practical unit of power comparable with the horse-power becomes the kilowatt. Had my proposal found favor, the practical unit of power would have been the watt, and Siemens' unit would have been the milliwatt. I venture to think the acceptance of my unit would have hastened the departure of the term horse-power.

I was surprised and pleased the other day to find in Marseilles that the man directing the electric tram cars in that city, corresponding to the driver of the old horse car, sometimes called in America the motorneer, is called the wattman, and I have since learned that this term is very general in France. I hope our friends in Glasgow who are about to introduce electric traction in their city will follow France's good example and honor one of their greatest mechanical heroes by inaugurating the same name in Great Britain. Energy, though so protean in its character, retains its joule throughout all its changes. Every joule impressed on the surface of the ocean by the rays of the sun adds to the moisture of some cloud which, condensed into rain by contact with our cool highlands, feeds a river like that which forms the Falls of Foyers. The engineer directs this falling water through the blades of a turbine, and each joule that passes assists in rotating dynamos to excite strong electro-magnetic fields and powerful currents of electricity, which in their turn produce light, the intensest heat known, and chemical decomposition. This lump of aluminum, the first produced at Foyers, has been extracted from crude bauxite by the expenditure of about 60,000,000 joules. Thus in every stage of its transformations the joule remains the same mechanical unit, while the energy that it measures out proteuses Proteus.

The grand principle of the conservation of energy teaches us that no energy is ever lost. The total energy present assumes a form either useful or useless to man. The skill of the engineer is devoted to render that which is useless useful, and no one has helped him to do this more thoroughly than James Watt. The rapid introduction of electrical energy for electric light, for traction and for the transmission of the waste powers of nature to distant places, is revolutionizing our systems of units. The British Association in 1861 formed a committee to consider the question of general electrical measurement, and aided by Wheatstone, Varley, Balfour-Stuart, Siemens, Matthiessen, Clerk-Maxwell, Joule, Fleeming Jenkin, who have departed, and Lord Kelvin who remains as active as ever, they have so impressed the world by their work that, aided by the Congresses in Paris in 1881 and 1883, in Chicago in 1893, and in London in 1894, the system proposed has been universally adopted, so that electricians in all parts of the world, whatever their nationality or their language, use the same terms, the same measures, and the same units. The ohm is the unit of the resistance, which has to be overcome in any case of the flow of electrical energy ; the volt is the unit of pressure which maintains this energy through this resistance ; the ampere, the result of one volt acting through one ohm, is the unit of current, and the coulomb is the unit of that electrical quantity which is being driven. These are electrical units pure and simple ; but leading from and associated with them are the mechanical units—the joule and the watt.

The watt is universal and exact ; the horse-power is not. The latter equals in England 550 foot pounds per second ; France, 542.47 ditto ; Germany, 582.25 ditto. How can one reconcile such discrepancies Yet the horse-power is maintained in high places with all the fervor and enthusiasm of an old Scotch Covenanter, or the *non possumus* of a good old English Tory. The foot pound per second equals 1.356 watts. The horse-power therefore equals 746 watts. The watt equals 0.7373 foot pound per second. The kilowatt, 1000 watts, equals 1.34 horse-power. If, in order to obtain the value of the power, we divide by 33,000 the ordinary formula, A P S n, where A is the effective area of the piston in square inches, P the mean pressure of the steam in pounds per square inch during one stroke, S the length of this stroke in feet, and n the number of strokes per minute, we get it in horse-power. If we divide it by 44,238 we get it in kilowatts. Horse-powers multiplied by 0.746 are expressed in kilowatts; and kilowatts multiplied by 1.34 are expressed in horse-power. The new system is universally used by electrical engineers.

Electrical Units.

Names, when well selected, secure precision of language ; a watt is a watt and nothing else. A pound, on the other hand, may be either a force, or a mass, or inertia. Names fix ideas. Every electrical workman has a definite and clear conception of an ohm or an ampere. He requires no definition to impress them on his mind. The name alone conveys to him all he wants to know. They become fundamental ideas. There is no ambiguity, hence there is no difficulty either in teaching or in practice. The same benefits would certainly arise if we applied the term kilowatt to the unit of power. No one would have to ask, "What sort of kilowatt do you mean?" The same principle which enabled Watt to examine the interior of his cylinder enables the electrician to examine and record the behavior of his plant and his circuits. Power houses which generate electric currents for supplying electric light or for working trams are generally supplied with recording instruments that tell of the energy expended at each instant of the 24 hours. The engineer has thus before him every moment the history of the whole previous day's work. Here, for instance, is a record of a whole day's work in Rome and here a record of another day at the General Post Office in London.

We are able by means of meters to measure water consumed or gas burnt in our premises. The former is sold by the 1000 gallons and the latter by the 1000 cubic feet. Similarly we measure the electrical energy that is utilized in our houses and factories by the kilowatt hour—that is, we pay 6 pence for every 3,600,000 joules we direct to meet our wants. The custom of paying for power applied is by no means a modern innovation, but it has recently been

made legal by the Electric Light act of 1882. That act makes legal as a Board of Trade standard or a unit a kilowatt hour. It is there defined as 1000 volt amperes per hour; the watt had not then been adopted. Thus the board of trade unit becomes a unit of work done, and we are able to sell as a commercial commodity the work done by 1 kilowatt, or, in Watt's language, the work done by 1⅓ horse-power in one hour. Through the kindness of Lord Kelvin I am able to show you many forms of meter, the offshoot of his own genius and his industry. There is no one who has done so much to secure accurate, sensitive and reliable instruments of precision and of measurement.

Electrical energy is supplied in Glasgow for 6 pence per unit for the kilowatt hour has not yet received a name. It was proposed to call it the "kelvin," and a more appropriate name could scarcely be found, for who is more entitled to share the glory of Watt's name than he who has again made Glasgow University so famous? Lord Kelvin himself objected to its introduction, but in a case of this kind personal wishes scarcely can control the public will, and the necessity for a name is becoming so strong that I shall not be surprised to find electrical energy sold at so much per kelvin, even though it be measured by a Kelvin meter.

I should have liked very much to have diagnosed the causes which have led Scotch universities to dominate so strongly the advances of practical science. The pages of the history of the branch of engineering I have so lightly touched upon teem with the names of Watt, Rankine, Clerk-Maxwell, Fleeming Jenkin, and Lord Kelvin—great towers of light that have brightened up and hastened our rapid progress. Why is it thus? Is it that it needs the strong common sense influence of practice and the wholesome conception of utility, so characteristic of the North, to be impressed on the abstract views of pure science to secure concrete advances in its practical applications? Our English universities are, in this direction, out of the running. They adhere to abstract science. But in Glasgow the doctrine of energy has been crystallized and applied; it is from Glasgow that so much of our engineering knowledge has emanated, it is to Glasgow that we shall continue to look for more light, and it is therefore to Scotland that we must accord all honor.

Some Notes on Electrotyping, Plating and Gilding.

The following article by J. Warren is reprinted from *Electricity*: Electrotyping is the art of effecting a non-adherent, metallic deposit, thick enough that the metal deposited may itself form a fresh object and be capable of a separate existence apart from the original mold, though at the same time preserving the configuration and dimensions of the latter. This art, among the earliest in which electricity plays a part, dates back some considerable time and has proved of great service in the reproduction of valuable casts, seals, medallions and other articles for various purposes.

The first step in the process is the preparation of the mold. The substance originally used for the construction of these necessary adjuncts was plaster of paris. This substance is, however, porous and requires to be rendered impermeable. The materials most commonly used of later years are stearine, wax, marine glue, gelatine, india rubber and fusible alloys. With hollow molds it is a good plan to arrange an internal skeleton of platinum, for ultimate connection with the anodes, in order to secure a good electrical contact with all parts of the mold. When covering several pieces at once it is as well to connect each of them with the negative pole by an iron or lead wire of suitable dimensions.

Having prepared the molds in the usual way—viz., by obtaining an impression in the material when soft and allowing it to set—they should be given a metallic coating on their active surfaces of pure powdered plumbago applied with a polishing brush.

For delicate and intricate objects that known as the wet process is most suitable. It consists in painting the object with two or more coats of nitrate of silver and ultimately reducing it by a solution of phosphorus in bisulphide of carbon.

The baths, which are the next most important item in the process, are always the same, whatever the work in hand may be, and are prepared as follows: A certain quantity of water is put in a jar and to it is added from 8 to 10 parts in 100 of sulphuric acid, in small quantities, stirring continually in order to dissipate the heat generated by the admixture of acid and water. Sulphate of copper (bluestone) is then dissolved in the acidulated water at the normal temperature until it will take up no more. The solution is always used cold and must be maintained in a saturated condition by the addition of copper sulphate crystals or suitable anodes.

For use it should be poured into vessels of clay, porcelain, glass, hard brown earthenware or india rubber. For large baths wood may be used, lined on the interior with an impervious coating of acid proof cement, india rubber, marine glue or even varnished lead sheets.

If the solution be too weak and the current on the other hand be too strong the resulting deposit will be of a black color. If too concentrated a solution and too weak a current be employed a crystalline deposit is obtained. To insure a perfect result a happy medium in all things is therefore necessary.

During the process of deposition the pieces should be moved about in the bath as much as possible in order to preserve the homogeneity of the liquid. If this be not attended to stratification and circulation of the liquid is produced by the decomposition of the anode, and is rendered visible by the appearance of long, vertical lines on the cathode.

For amateurs and others performing small and occasional experiments the following simple apparatus will be found very serviceable. Place the solution of sulphate of copper in an earthenware or porcelain jar, in the center of which is a porous pot containing an amalgamated zinc and a solution of sulphuric acid and water, about two or three parts in 100.

At the top of the zinc a brass rod is fixed, supporting a circle of the same metal, the diameter of which is between that of the containing vessel and the porous pot. From this metallic circle the pieces are suspended in such a manner that the parts to be covered are turned toward the porous pot. Two small horse hair bags filled with copper sulphate crystals are suspended in the solution to maintain its saturation.

I will now pass on to the process of electroplating, or the securing of thin, adhesive, metallic deposits. There are several stages to be passed through in this process, and I will take them in the order in which they come.

Firstly, cleaning the articles to be plated. To remove grease warm the pieces before a slow fire of charocal or coke, or in a dull red stove. Delicate or soldered articles should be boiled in a solution of caustic potash, the latter being dissolved in ten times its weight of water.

We next pass on to the scouring process, which is effected in a scouring bath. The latter is composed of 100 parts of plain water to from 5 to 20 parts of sulphuric acid. The articles may generally be put in hot and should be left in the bath till the surface turns to an ocher red tint.

The articles, after having been cleansed of grease by the potash solution in the first place, must be washed in water and rinsed before being scoured. Copper or glass tongs must then be used for moving the articles, as they must not afterward be handled. For small pieces, suitable earthenware or porcelain strainers may be used.

The next stage is the spent nitric acid bath. This consists of nitric acid weakened by previous use. The articles are left in until the red color disappears, and so that after rinsing they show a uniform metallic tint. The rinsing should be thoroughly carried out.

The articles having been well shaken and drained are next subjected to the strong nitric acid bath, which is made up as follows:

	Volumes.
Nitric acid of 36° Beaumé	100
Chloride of sodium (common salt)	1
Calcined soot (lamp black)	1

The articles must only be immersed in this bath for a few seconds. Avoid overheating or using too cold a bath. They are next rinsed thoroughly with cold water and are again subjected to a strong nitric acid bath to give them a bright or dull appearance as required.

For articles to have, when finished, a bright appearance, plunge them for a few seconds, moving them at the same time rapidly about, in a cold bath of the following composition:

	Volumes.
Nitric acid	100
Sulphuric acid	100
Chloride of sodium	1

Again rinse thoroughly in cold water.

The corresponding bath for a dull or "mat" appearance is composed of:

	Volumes.
Nitric acid	200
Sulphuric acid	100
Sea salt	1
Sulphate of zinc	1 to 5

The duration of immersion in this bath varies from 5 to 20 minutes, according to the dullness required. Wash with plenty of water. The articles will then have a nasty appearance, which will, however, disappear on plunging them for a moment into the brightening bath and rinsing quickly.

The pieces are next treated with the nitrate of mercury bath for a few seconds:

Plain water	10 kgs
Nitrate of mercury	10 grams.
Sulphuric acid	20 grams.

It is necessary to stir this bath before using it. For large articles the proportion of mercury should be greater. An article badly cleaned will come out in various shades and

lacking its metallic brightness. It is better to throw a spent bath away than attempt to strengthen it.

The various pieces, after having passed through these several processes, are then ready for the plating bath.

Now for a few words on the subject of gilding. Small articles are gilded hot, large ones cold. The cold cyanide of gold and potassium both is composed as follows :

Distilled water	10 liters.
Pure cyanide of potassium	200 grams.
Pure gold	100 grams.

The gold, transformed into chloride, is dissolved in 2 liters of water and the cyanide in 8 liters. The two solutions are then mixed and boiled for the space of half an hour.

The anode must be entirely submerged in the bath, suspended from platinum wires and withdrawn immediately the bath is out of action.

Hot Gold Bath.—Zinc, tin lead, antimony and the alloys of these metals are better if previously covered with copper.

The following are the formulæ for the other metals per 10 liters of distilled water :

Crystallized phosphate of soda, 600 grams; alloys rich in copper, 500 grams castings.

Bisulphide of soda, 100 grams; alloys rich in copper, 125 grams.

Pure cyanide of potassium, 10 grams; alloys rich in copper, 5 grams.

Pure gold transformed into chloride, 10 grams; alloys rich in copper, 10 grams.

Dissolve the phosphate of soda hot in 8 liters of water, let the chloride of gold cool in 1 liter of water ; mix little by little the second solution with the first; dissolve the cyanide and bisluphide in 1 liter of water and mix this last solution with the other two. The temperature of the bath may vary between 50 and 80 degrees C.

Silvering.—For amateurs a bath of 10 grams of silver per liter is sufficient. Dissolve 150 grams of nitrate of silver, equivalent to 100 grams of pure silver, in 10 liters of water and add 250 grams of pure cyanide of potassium. Stir it up until completely dissolved. and then filter the solution. Silvering is generally effected cold except in the case of small articles. Iron, steel, zinc, lead and tin are better if previously copper plated and then silvered hot. The cleaned articles are first treated in a nitrate of mercury bath, being kept continually in motion.

With excess of current the pieces become gray and blacken. In the cold bath anodes of plantinum or silver should be employed. Old baths are in this case preferable to new. They may, if required, be artificially aged by the addition of one or two parts in 1000 of liquid ammonia.

If the anode blackens the bath is poor in cyanide. If it becomes white there is too much cyanide—the deposit being too rapid does not adhere. The deposit may be taken as normal and regular when the anode becomes gray during the passage of the current and white again when it ceases to flow.

We now pass on to the subject of nickeling. The first experiments in this industry were due to Smee, who was followed by Becquered and afterward, in 1869, by Dr. Isaac Adams. The vat should be of glass, porcelain or earthenware, or a case lined with impermeable gum. The best nickel bath is prepared by dissolving to saturation, in hot distilled water, nickel sulphate and ammonium, free from oxides of alkalies and alkaline earthy metals. The proportion of salt to dissolve is one part by weight to ten of water. Filter after cooling and the bath is then ready for use.

When the bath is ready and the battery set up, the wires from the latter are joined by means of binding screws to two metal bars resting on the edge of the vat. The bar joined to the positive pole of the battery supports, through the intervention of a nickel plated copper hook, a plate of nickel, constituting the soluble anode, which restores to the bath the metal deposited on the cathode by the electrolytic action. From the other bar are suspended the articles to be plated. These latter should be well polished before being put into the bath. To remove all grease from them, scrub them with brushes soaked in a hot solution of whiting, boiled in water and carbonate of soda.

Copper and its alloys are cleaned well in a few seconds by immersion in a bath composed of ten parts by weight of water and one of nitric acid. For rough articles, two parts of water, one of nitric acid and one of sulphuric acid. For steel and polished castings, 100 parts of water to one of sulphuric acid. The articles should remain in the bath until the whole surface is of a uniform gray tint. They are then rubbed with powdered pumice stone till the solid metal appears. Iron and steel castings are left in the bath for three or four hours and then scrubbed with well sifted sand.

If the current be too strong the nickel is deposited gray or even black. An hour or so is time enough to render the coat sufficiently thick and in a condition to stand polishing. When the articles are removed from the bath they are washed in plain water and dried in hot sawdust.

To polish the articles they should be taken in the right hand and rubbed rapidly backward and forward on a strip of cloth soaked in polishing powder boiled in water, the cloth being firmly fixed at one end and held at the other in the left hand. The hollow parts are polished by means of cloth pads of various sizes fixed on sticks. These pads must be dipped in the polishing paste when using them. The articles, when well brightened, are washed in water to get rid of the paste and the wool threads and finally dried in sawdust.

Aluminum in Place of Brass.

The subject of aluminum as a substitute for brass in various lines of manufacture is one that is attracting an increasing amount of attention. In his recent Franklin Institute lecture on the " Utilization of Aluminum in the Arts," President Alfred E. Hunt of the Pittsburgh Reduction Company gave the results of his experience in the matter as follows :

Aluminum is now sold at a price per pound about equal to that of nickel, and not largely in excess of that of German silver. Volume for volume, it is much cheaper than German silver, and for replacing German silver or britannia metal as a base in silver plated vessels its power of retaining heat and its lightness, together with its much cheaper price, will certainly present such advantages as will cause its extensive use.

In the aluminum trade, the manufacturers have been confronted with the anomalous position that it is necessary for them to sell the metal at prices to compete with brass in sheet, wire, tubes, &c., as cheaply as similar articles are sold in brass. To do this, they have been obliged to put in the plant for the efficient and economical working of aluminum in sheets, bars, wire, tubes, &c., upon a scale sufficiently large to produce the best results, and that before the business was sufficiently developed to warrant the installing of the plant.

The brass manufacturers have the advantage of a large business already established, with many plants working under the most economical conditions as to their facilities for rolling, drawing, &c. It has been the experience so far that the establishments having these facilities for working in brass are not willing to work aluminum at anything like the same relative prices, but have desired a profit of from 50 to 100 per cent. beyond that with which they were content in brass for similar work in aluminum, so that the manufacturers of aluminum have found themselves in the unsatisfactory position of having to put in their own rolling mills and drawing apparatus of the most approved pattern in order to compete in price for work in similar articles of brass. To be compelled to put in the considerable plants necessary for working aluminum at the same time they were developing the business for increasing the output of the ingot metal has proved considerable of a hardship to the manufacturers of aluminum. So far as the experience of the Pittsburgh Reduction Company goes, it is about the same for an aluminum plant as for a steel plant—that it takes about one-fourth the area of the plant for the actual manufacture of aluminum ingots and three-fourths of the occupied territory for plant in working up the metal in foundries, rolling mills and the like.

Aluminum has now reached a point in selling price where it is about equivalent to brass for many purposes. Brass averages from 3.15 to 3.20 times heavier than aluminum, and when the price of brass per pound is multiplied by this factor it will be seen that aluminum to-day is really a cheaper metal than brass for many purposes, and that it will in the future be a question of the " survival of the fittest " between the two metals. It will take years before workmen will gain the experience in handling aluminum as adeptly as brass, occasioned by lifelong experience in working brass. It will take years before the stock of dies will have accumulated with the proper clearance for aluminum over that needed for brass, so that even with aluminum eventually coming out the superior metal, manufacturers must reckon upon only a gradual approach of tonnage of aluminum consumed to that of brass

For many purposes brass is undoubtedly the superior metal. It is essentially a better bearing metal than aluminum. It can be brazed, as aluminum cannot be at the present time—a difficulty which handicaps aluminum from being used in place of brazed brass tubing, &c. Brass can be subjected to a higher temperature under working conditions than can aluminum with its lower melting point, and brass can be soldered more easily than aluminum and the soldered joints made much more lasting.

Aluminum is a very sonorous metal, and it has been used quite extensively for gongs in the place of brass. In metal sheets, whitened by scratch brush or other form of satin finish, aluminum has replaced brass for clock faces to a considerable extent.

A bicycle census recently completed in France shows that during the calendar year 1896, 329,818 wheels were registered, as compared with 256,084 in the preceding year.

STOVE TRADE NOTES.

THE UNION VAPOR STOVE COMPANY.

The adjourned meeting of the Vapor Stove Manufacturers' Association was held at the office of the Standard Lighting Company, Cleveland, Ohio, September 23, 1897, at which time the association adjourned *sine die*, and the Union Vapor Stove Company were organized under the laws of the State of Ohio.

To this company the various manufacturers sell all their patents on gasoline stoves, and the Union Vapor Stove Company in turn license the different manufacturers to manufacture vapor stoves under said patents. This company are supposed to own and control all patents on vapor stoves, and each stove made under these patents will be so designated by a license label.

The company elected Paul Schneider of Cleveland as president, E. C. Baxter of Mansfield as vice-president, and F. L. Alcott of Cleveland as secretary and treasurer.

The B. C. Bibb Stove Company.

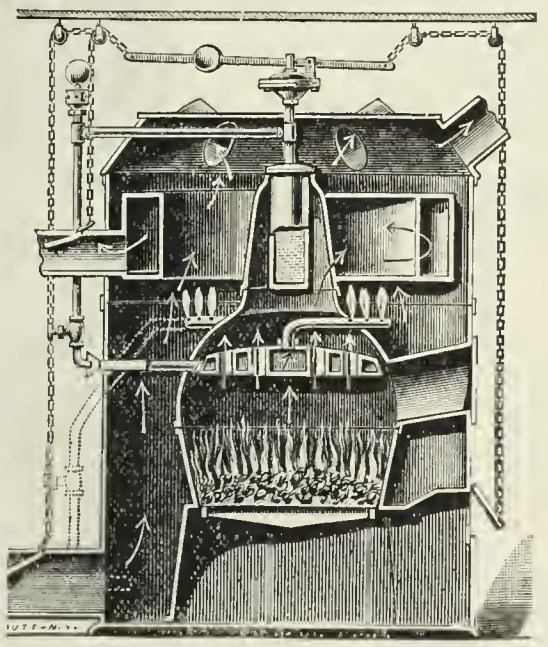
The annual catalogue of stoves, ranges, fire place heaters, furnaces, hollow ware, &c., which is being sent out by the B. C. Bibb Stove Company of 107-109 Light street, Baltimore, Md., and with foundry at Port Deposit, that State, is an attractive publication of 104 pages, measuring 9¼ x 12 inches and bound in cloth lined paper covers. The design of the side title embodies the name of the company with an indication of the lines of goods manufactured, printed in old gold, red and dark green upon a deep crimson ground. The usual notices to the trade relative to terms and conditions are found in the early pages of the volume, together with suggestions to stove dealers with a view to facilitating prompt shipments and the avoidance of delays and errors. There are also outlines of a cook stove and range presented for the assistance of the dealer in naming the different parts for which he may want repairs, following which are general directions for setting and operating stoves and ranges, telegraphic code and illustrations of elevated pipe shelves. The latest addition to the company's line of ranges is the Harford, a six-hole construction, which can be used for burning either coal or wood. The ornamentation is effective yet unpretentious, while the construction embodies the latest improvements. The Tuxedo, another member of this general class, and to which several pages of the catalogue are devoted, has met with a very gratifying reception at the hands of the trade, and there is every appearance of a bright future for it. Other ranges include the Maryland, Newport, Avalon, Arcadia, Glymont, Oriole, the Improved Daisy and the Improved Minor.

The attention of the dealer is next invited to a varied assortment of heaters, of which the Wild Fire, an air tight wood stove, is among the latest productions. This has cast top with an expansion piece, cast bottom, heavily ribbed, cast draft flue and smoke guard, and adjustable smoke pipe collar. The stove is made in two styles, the cheaper having a single casing lined with heavy sheet steel, and the other double casings with a chamber between for the circulation of hot air. There are also shown various styles of Franklins, base burners, sheet iron cylinder constructions and globe and cannon stoves. After the heaters attention is given to the Calvert range, made for brick setting and constructed especially to heat upper rooms. The Harford range is also shown with horizontal boiler, while the Tuxedo is shown in both portable form and in brick setting. Under the name Bolton the company offer a new double oven brick set range, which is furnished with either duplex or plain dumping basket grate. It is made in one size and is of substantial appearance.

Another novelty which the company have brought out in the way of a fire place heater is the Radiant No. 2, this being their smallest production in this line. It embodies, however, all the latest improvements, such as sectional fire pot and magazine, clinker removing grate, &c. Its construction is such that it can be placed in a very shallow fire place and yet sacrifice none of its heating powers. It has been brought out specially to meet the wants of those occupying or building medium sized houses, and the price is made accordingly. An interesting feature of the work is found in the diagrams which are presented showing the proper manner of setting Bibb's Original Baltimore made fire place heaters, these being accompanied by directions for doing the work. A great deal of miscellaneous matter is presented and the catalogue concludes with an index alphabetically arranged.

Positive Air Supply Attachment for Furnaces.

Those who have had experience with the operation of hot air furnaces know how at times it is difficult to secure a supply of air through some one or more of the pipes leading from the furnace. Henry C. Steinhoff, 406 Blum street, Union Hill, N. J., has brought out the device shown in the accompanying illustration, which he claims is a method of securing a positive air supply for hot air furnaces. It consists of a boiler located in the upper part of the furnace exposed to the fire for generating steam for the double purpose of acting as an automatic damper regulator and also of supplying the furnace with air. A pipe is taken from the boiler, which is automatically supplied with water, through the furnace casing to a point where it turns down and is used for forcing a blast of air into a superheater. The superheater is a hollow casting, circular in form with a partition so arranged that the jet of steam and air forced into it must travel completely



Positive Air Supply Attachment for Furnaces.

around it and become heated to a high temperature before it passes swiftly down the outlet from the superheater through a pipe which is placed in the cold air supply duct to the furnace. It is claimed by superheating and expanding the air and the steam a high velocity is secured at the outlet of the pipe which is placed in the cold air duct, the end being located so as to discharge toward the furnace, drawing in with it a strong current of air, insuring, it is said, a constant supply of air to the furnace regardless of the force and direction of the wind outside the building or the length and direction of the hot air pipes attached to the furnace. It is further claimed that the moisture added to the air by the steam jet is sufficient to make it pleasant and avoid the dryness which is sometimes complained of by those whose houses are heated with a hot air furnace system.

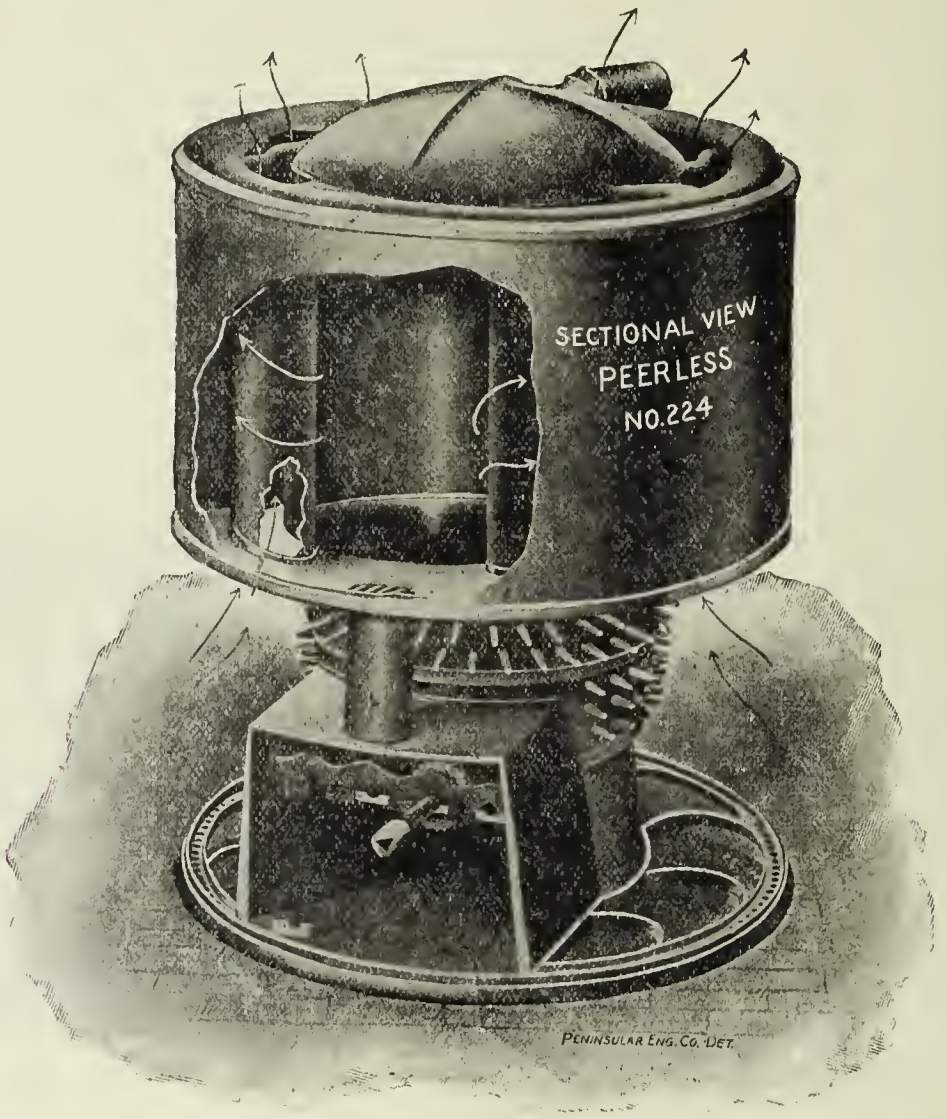
The Kelsey Warm Air Generator.

"How to Warm Your House" is the title of a prettily arranged folder which is being sent to the trade by the Makin-Kelsey Heating & Mfg. Company, 1717 Chestnut street, Philadelphia, Pa. The text of the matter is a description of the Kelsey warm air generator, made by the Kelsey Furnace Company of Syracuse, N. Y. The merits of this heater, not only for use in new houses, churches, auditoriums, &c., while in process of construction, but in places where the ordinary hot air system has heretofore been used, are set forth. As a general thing the same flues can be employed, often, it is pointed out, doing away with one or more fires, with a consequent saving of fuel

that will in the course of a few years pay for the new plant. By means of an attachment which the manufacturers employ in connection with their furnace, rooms located at quite a distance from the generator may be satisfactorily heated. An interesting feature of the folder is a half-tone reproduction from a photograph of the residence of Henry Delaplaine, at Merion, Pa., which is heated by a No. 24 Kelsey warm air generator. A table which is given in connection with the descriptive text gives the dimensions and capacities of the various sizes in which the warm air generator is made.

The 200 Series Peerless Furnace.

In the accompanying illustration we show a sectional view of the 200 series Peerless hot air furnace, made by the Detroit Furnace & Heater Company, Detroit, Mich. The company call attention to this heater as having improvements in construction, among which are a solid ring base and an extra deep ash pit, which is provided with a triangular grate so arranged that it can be entirely removed or replaced within a few seconds. Another feature of the furnace is the amount of surface presented, the fire pot being of the extended surface type so that the air in entering the furnace comes in contact with a series of pins and is not only heated but diffused, preventing a blast of air passing through the furnace without being heated. Above the fire pot is a large double steel radiator so arranged that the greatest amount of surface is provided in it, and to effect an indirect draft so that the principal heat of the fuel consumed is utilized in heating the air. The feed door is made of such size that in addition to burning coal wood may be burned with facility. These furnaces are made in five sizes, with fire pots 18, 20, 22, 24 and 27 inches in diameter. A catalogue containing full particulars and dimensions can be secured on application. The company say, in reference to the fire which recently visited their plant, that they are already established in other quarters, and as their stock of furnace castings was stored where it was not damaged by the fire their shipments will not be delayed. They further state that the popularity of their goods has increased their business this year beyond their expectations, and they are preparing, in building their new plant, to increase their output.



The 200 Series Peerless Furnaces.

The Excelsior Stove Repair Mfg. Company, Quincy, Ill., advise us that they are operating their plant day and night to keep pace with the orders on their new lines of Excelsior, Imperial and Regal Sheet Iron Air Tight Wood Heating Stoves, Up and Down Draft Radiators, and Smokeless Hot Blast Coal Heaters.

A Warning to Buyers of Standard Articles Against Offer of Substitutes.

The gullibility of the average consumer of merchandise of all kinds, says the Chicago *Times-Herald*, is well known and the ability of "shrewd" (we should say dishonest) merchants to palm off imitations of articles which have gained a reputation and are demanded by name is also well known. In making small and insignificant purchases it is not to be wondered at that consumers can often be induced to accept substitutes or articles which are claimed to be "just as good" by the interested merchant, but when it comes to articles of value which are likely to be used the greater part of a lifetime, we think the purchasers of such goods are as foolish as the merchant is dishonest if they allow themselves to buy anything but just exactly what is asked for by name. As a glaring instance of what can be done in this connection, we desire to name but one very well known article of household use—to show what is often attempted and sometimes accomplished. As long ago as 1882 the Michigan Stove Company of Detroit, Chicago and Buffalo placed upon the market a complete line of cooking and heating apparatus for all kinds of fuel and of the highest possible degree of merit, which they marketed under the name of Garland stoves and ranges, and as this name was applied to but the highest grade or quality of each type of stove or range their products were an electric success and the name "Garland" has always stood as the symbol of goods of first grade only, and they are to-day the only goods of their kind sold under any trade name which are not made in several qualities. Other stove makers, counting no doubt upon the credence of the public, commenced to apply a trade name to lines of goods varying in quality from very good down to the cheapest and most inferior grades, and then imitated the shape and style of the Garland trade-mark, even to the shape and arrangement of the lettering—copying even the colors in Garland posters, imitating the designs of Garlands—with the result that many unscrupulous stove merchants have been successful in selling third and fourth grade imitations of Garlands upon the statement

that what they offered were "just as good," &c. The courts have closed the factories of some of the most shameless of these imitators, enjoined others, and yet there are those who escape the pale of the law and continue to dupe the public—whom, we repeat, are themselves to blame for not insisting upon having a Garland and nothing else.

The above is but one of many instances which might be cited, but it is sufficient to show that it is not only small articles of merchandise upon which consumers can be deceived, but large and important ones as well. When will the buying public learn to protect itself?

ODD PLATES.

The display of Andes Stoves and Ranges by M. A. Duane at the Danbury, Conn., fair excelled all previous exhibits of the kind. Among the several grades of Andes shown was the Peerless Andes Range, which won approval on all sides. The Peerless Andes has all the desirable features, being modern, first class, and containing all improvements. The headquarters for the Eastern branch, Phillips & Clark Stove Company, makers of the Andes Stoves and Ranges, is at 139 River street, Troy, N. Y.

The following well-known traveling salesmen, representing Henry N. Clark Company, spent several days this week at their store, 103-105 Blackstone street, Boston: T. W. Burden, O. A. Ballard, J. W. Denny, L. W. Barnes. These gentlemen were absorbing additional information in regard to the season's line of goods, which includes Range, Stove and Furnace Repairs, Stove Dealers' Supplies of all kinds, Parlor Stoves and Furnaces, Refrigerators, Oil Stoves, &c. They will soon start out with revised prices and a complete line of 'Parlor Stoves and Henry N. Clark Company's Furnaces.

The Detroit Stove Works, Detroit, Mich., intimate by means of a colored card which they are distributing to the trade that dealers had better hurry if they wish to secure their share of the coming prosperity. The card is of a size which can be sent through the mail, and has upon the address face a picture of a tiger of fierce expression and extended paws making a flying leap through the air. The picture appears on a colored ground, and underneath in bold faced black letters is the inscription "You'd better hurry." The other side of the card tells why haste is expedient, and winds up with the request that the dealer send for copies of circulars and catalogues which the company have isued. These include their 1897-98 catalogue of Jewel Stoves and Ranges, special information about any of their manufactures, and prints of their series of 1897 newspaper advertisements.

True, Blanchard & Co., Newport, N. H., recently unloaded two carloads of Beckwith Round Oak Stoves, which is said to be the largest shipment of Stoves ever unloaded in Newport at one time.

Samples of Smith's Patent Labor Saving Leather Pattern Fillet are seen in the New York offices of many of the Stove manufacturers, having been sent out by Smith's Pattern Works of Akron, Ohio.

Dunbar & Ashley have hung out a fine new sign at 113 Beekman street, New York City, announcing that they were making a specialty of the Fuller & Warren Company's Hot Air Furnaces and Ranges, and are prepared to do a Sheet Metal contracting business in the heating line for furnace work and indirect and blower systems of steam and hot water heating.

Green & Logan, Bridgeport, Conn., have already set 40 of their Culver Hot Air Furnaces this year, and have several contracts on their books to be filled.

The firm of Bridgeford & Co., Louisville, Ky., have just been reorganized, and C. W. Adams, late of Somerset, Ky., admitted as a partner.

The latest reports from Detroit are to the effect that the Detroit Stove Works of that city are running their plant night and day, the night shift going out at 5 o'clock in the morning and the day force beginning operations at 7 o'clock.

The Eclipse Stove Company of Mansfield, Ohio, have issued a supplementary sheet to their Steel Range Catalogue No. 14, recently sent out to the trade, the two pages of the sheet illustrating a new and smaller size of the Triumph Eclipse Steel Range, which has been brought out since the catalogue was issued. The new Range is of handsome appearance, has duplex grate, and is made only in square top with high closet, high shelf or tea shelf. The oven measures 14 x 18 x 12 inches, the top surface 26 x 31 inches, while the hight of the Stove is 28 inches. The company state that if Catalogue No. 14 has been lost or mislaid another copy will be forwarded on application.

With the enterprise which has marked the progress of John P. Schaffer of 18 Wood street, Pittsburgh, Pa., in the heating trade he is now sending out a vest pocket memorandum book which when opened out full shows on the covers a fine linen handkerchief with a knot fastened in the corner, with the suggestion: "This will remind you of John P. Schaffer." On opening the book the right hand pages have spaces for memoranda, and the left hand pages commence with a high grade Hot Air Furnace, and different pages show a variety of Furnaces and combination Heaters adapted for all kinds of buildings, from the most handsome residence to the building in which the price of the heating apparatus must be very carefully considered. The last page has a calendar for 1898.

The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, are making a specialty of large Warm Air and Ventilating Pipes, round and square, of both galvanized iron and tin, and have recently shipped a carload of such material to Muscatine, Iowa, for use in the heating and ventilating of a large school house at that place. These Pipes are used also in connection with steam heating plants for indirect flues, and can be furnished by the company of any size and in any angle desired. They have recently installed a lot of machinery for the manufacture of these goods. J. R. Gill, formerly with Hess, Snyder & Co., and J. Thos. Ryan, late with the Brand Stove Company, both well-known Furnace salesmen, have entered the employ of the Excelsior Company, and are already on the road showing up the merits of the Excelsior line. The Excelsior Company have now six men on their list of travelers, and their shipping department is working overtime to get off the orders which they are sending in.

R. Robinson & Sons, 107 Lake street, Chicago, are doing a specially good business in Furnaces, being behind in their orders owing to the heavy demand. Their largest business is in their tubular Furnaces, the demand being principally for good heating appliances which can be confidently recommended. Some cheaper Furnaces are being sold, but the proportion is small.

Mr. Blymyer, formerly of the Blymyer Brothers Company of Mansfield, has bought out H. R. Hamilton, at 67 Lake street, Chicago, and will represent the Monarch Stove Company in all their various lines for the States of Illinois and Indiana, and will carry a complete line of samples on his floor, look after the trade vigorously both in the city and the two States named and be identified with the Monarch goods from this time on. Mr. Blymyer took possession of the business on September 20, and continues the force of salemen and office help as heretofore connected with Mr. Hamilton.

George G. McMurtry, president of the Apollo Iron & Steel Company of Pittsburgh, sails for Europe on Saturday, October 9. Mr. McMurtry for the past three years has labored early and late at Vandergrift, the new model town of his company, and goes abroad to enjoy a well earned rest. The date of his return is indefinite. During his absence his duties will devolve upon W. P. Bache, the treasurer of the Apollo Iron & Steel Company.

The special board appointed by the Navy Department to consider the needs of the Navy in the matter of new dry docks in their report submitted to Acting Secretary Roosevelt find that five new docks are urgently necessary, while one (the Port Royal, S. C., dock) should be enlarged immediately. The total cost of these docks, with the Port Royal improvement, is estimated at $5,775,000. Four of the docks, the board say, should be of concrete, namely, at Boston, 700 feet long, cost, $1,300,000; at New York, 500 feet long, cost, $1,200,000; at Norfolk, 500 feet long, cost, $1,100,000 (lengthening stone dock, $250,000); at Mare Island, 500 feet long, $1,100,000. Each of these concrete docks is to be completed in two years.

In a preliminary estimate of the amount of gold produced during the calendar year 1897, Mint Director Preston, at Washington, places the world's output of the yellow metal this year at not less than $240,000,000, being an increase in the annual production of more than $35,000,000 over last year. Of this production probably two-thirds will be used for commercial purposes and the other third will be used by the arts. In this case the world's supply of gold available for coin will be increased by a sum of nearly $160,000,000. Mr. Preston believes that the record of silver production will show no increase over last year.

Secretary Hester of the New Orleans Cotton Exchange has issued a statement of the world's visible supply of cotton, covering European points, the amount in transit for European ports and at the interior towns of the United States. He places it at 1,643,921 bales, as against 2,104,922 bales last year. Of this, 1,290,921 bales is American, against 1,827,822 last year, showing a decrease of 641,000 bales. Secretary Hester's statement shows the largest movement of cotton into sight for the month of September on record, except that of last season.

TRADE REPORT.

METAL MARKET.

Pig Tin.—During the early part of the week under review prices weakened somewhat, owing to heavy arrivals and pressure to sell on the part of some importers. Latterly the market has gradually improved, the weighty surplus stock having been closely taken up, sufficiently to leave the spot supply in closer control. The consumptive demand was good with liberal orders both in a wholesale and retail way. No change is made in jobbers' prices for small lots from store, 14¾c. per lb. being the ruling quotation for Straits Pig. There have been arrivals thus far this month of 835 tons.

Copper.—The market has been quiet with a weakish tone, although quotations show no change for the week. Business was of moderate volume, the demand from all quarters being rather below the average. Jobbers quote Lake Ingot at 12¼c., and Ansonia Grade Casting Copper at 11¼c. per lb.

Sheet Copper.—There is not much change to record in this department. The volume of business exceeds that of last year at the same season, and orders are more liberal. Purchasers are confining themselves less to a hand to mouth policy of buying, and are placing stock orders more freely. Prices are getting more uniform as the various mills are filling their order books and recent heavy cutting is not being repeated. The general tendency of prices is decidedy in an upward direction. Manufacturers, as a rue, refuse to quote for extended delivery, looking for a higher range of prices in the not distant future. For spot and early deliveries jobbers quote about 15c. per lb., basis, on small lots of Sheet Copper from stock.

Pig Lead.—The demand has been very tame throughout the week, and whoesale prices gradually softened under the weight of dullness and slighty freer offering from some quarters. At the close, however, there were some indications of an improved feeling, and the market steadied somewhat. In a retail way, business has been fair at slightly lower prices. The ruling rates for small lots of American Pig from store are 4½c. to 4⅝c. per lb.

St. Louis advices are as follows : The market for Pig Lead is without any features of interest. The demand is extremely light, but prices are well maintained.

Lead Pipe and Sheet.—A dull week is reported in these materials. Orders were of a very ordinary character, and prices remain without change. Eastern dealers quote 6¼c. per lb. for Lead Pipe and 7¼c. for Sheet Lead, subject to the customary discount.

Spelter.—There has been no demand here for other than comparatively small lots, such as consumers might need to meet current wants. This and rather freer offering from some quarters gives the market a slightly weaker tone. Quotations for small lots are a shade lower, 4¾c. per lb. being the outside asked by jobbers for Western Spelter.

St. Louis advices are as follows : Some heavy sales have been made during the past week, but no change in price is recorded. The total sales for the month of September are probably larger than in any month for several years past, and the stocks of unsold Spelter are extremely light. There seems to be an understanding among the leading producers not to advance this metal, and the price ruling to-day is more than likely to prevail for the balance of the year.

Sheet Zinc.—A quiet market with unchanged prices is noted. Jobbers quote 5⅝c. to 5¾c. per lb. for 600-lb. cash lots and 6⅛c. to 6¼c. for smaller quantities.

Antimony.—Sales have been very fair, and prices are steady at about 8¼c. to 8½c. for Cookson's, 7¾c. to 8c. for Hallett's, and 7¼c. to 7½c. for Japanese in small parcels.

Nickel.—Prices remain steady at 37c. to 38c. per lb. for small lots.

Aluminum.—A steady run of orders is reported. Prices are firm and unchanged at the list rates established by the Pittsburgh Reduction Company. No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 42c. per lb.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb. Scrap Aluminum is quoted at 30c. per lb., f.o.b. works at New Kensington, Pa.

Tin Plate.—The Steel situation still governs the Tin Plate market to a considerable extent. Mills find great difficulty in securing a sufficient supply of Bars, and are, in consequence, much delayed in their shipments on orders. There is still a scracity in Ordinary Cokes, which for spot delivery command a sharp premium over the current quotations. The demand for these Plates, however, has fallen off considerably during the week, as the canning season is practically over. The market for these, as well as for other lines, is rather dull at present. Prices show no sign of advancing, notwithstanding the firmer tone and the scarcity in the Steel market. In fact 5 cents per box under current quotations is said to have been accepted within a few days in some quarters. In the retail trade only a fair volume of business has been effected. Jobbers' prices are unchanged. Quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do.. 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40: American Charcoal Brights, Melyn grade, IC, 14 x 20, $4.55; Allaway grade, IC, 14 x 20, $4.15; American Charcoal Ternes, IC, 14 x 20. ordinary, $3.50 to $3.60. Foreign Plates sell in a small way only, and prices show no variation.

A special London cable dispatch of October 6, 1897, reports on the British Tin Plate market as follows: Tin Plate is slightly firmer, with prices on the basis of 9s. 4½d. to 9s. 6d. for ordinary Bessemer Cokes, f.o.b. Swansea, and the demand only fair.

Black Plate.—The demand for Black Plate for tinning is good and prices show a firmer tendency. In moderate quantities 2.45c. per lb., f.o.b. Pittsburgh, is quoted.

Sheet Iron.—The Sheet mills are rather hampered in their operations by reason of the inability of the Steel mills to make deliveries. Consequently they are themselves unable to make deliveries as specified in their con tracts. Meanwhile the demand for Black and Galvanized Sheets continues quite heavy, and some scarcity is experienced. Mills that are able to make prompt shipments—and they are few—are getting outside prices. They are all running to full capacity with an unusually heavy tonnage booked. Jobbers are also getting rather more than their recent share of orders for Sheets, although the strike of the cornice makers has restricted the demand in New York City and its immediate vicinity. A report of the meeting of the Black Sheet Manufacturers' Association, held in Pittsburgh on Thursday, will be found elsewhere in this issue.

Chicago advices are as follows: It is difficult if not impossible to secure early delivery for either Black or Galvanized Sheets. Some of the mills are full for the remainder of the year, and others are unable to promise delivery under at least 30 days. Small lots from stock of No. 27 Black are selling at 2.30c. and Galvanized at 80 per cent. off.

Old Metals.—The demand is increasing and prices are stiffening up, holders being less pressing in their offerings. A good export demand exists for Old Copper and Brass. Dealers are paying about the following prices for New York City delivery:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¼c.
Light Brass	per lb. 4¼c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 2¾c.
Zinc	per lb. 2 c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.00 to $10.50
Heavy Cast Scrap, per gross ton	$9.00 to 9.50
Stove Plate Scrap, per gross ton	5.50
Burnt Iron, per gross ton	4.50

The Philadelphia *Press* announces that negotiations are in progress among a number of capitalists of New York, Philadelphia and Boston which, if successful, will result in the substitution of American built steamships for the large number of foreign built craft now engaged in the West India fruit trade. It is expected that the new vessels will be built by the Cramps at Philadelphia.

THE IRON MARKET.

The only sign of wavering which has developed during the past week in the Iron trade is the weakening in the price of Bessemer Pig in Pittsburgh from $10.75 to $10.25, due partly to efforts to realize on the part of speculators and to a rapidly expanded production.

As against that we have heavy inquiries for Steel Billets and Tin Plate Bars for 1898 delivery, which many of the mills still decline to consider. It is certain, however, that some of the makers are booking business. In the Central West the current consumption of Steel is unprecedentedly large, and is notably urgent in the case of Sheet and Tin Plate Bars. For the present the capacity of the Steel works making them is overtaxed in spite of the fact that a Wheeling mill has remodeled during the summer to engage largely in this branch. Another large mill in the Valleys is to follow in a few months.

The markets in Foundry Iron have been quiet. The leading Southern makers are shipping heavily and are sold far ahead.

Pig Iron.—Aside from some pretty large purchases by a leading Pipe foundry there have been no sales worthy of special mention in the New York market. There is some inquiry for Northern Iron for 1898 delivery, but little has been done in that direction as yet. We quote as follows : Northern brands, No. 1, $11.75 to $12 ; No. 2, $11.25 to $11.50 ; No. 2 Plain, $10.75 to $11. Southern brands, same delivery : No. 1, $11 to $11.25 ; No. 2, $10.50 to $10.75 ; No. 1 Soft, $11 to $11.25 ; No. 2, $10.75 to $11.

Prices of Pig Iron in the Philadelphia market are probably stronger than they have been at any time during the year. The feeling during the past few days has been stronger, owing to the diversion of a good many brands to markets at a distance, leaving few but local brands to supply the nearby trade. The movement has been quite heavy during the week, and so far as Pig Iron is concerned prospects are very favorable. Furnaces are well sold up, and deliveries are taken almost as rapidly as the Iron can be shipped, so that there is no room for complaint. The range of prices for seaboard deliveries may be given as follows, with the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.50; No. 2 X Foundry, $11.25 to $11.50; No. 2 Plain, $10.75.

Sales of local Iron in the Chicago district are still equal to shipments, thus keeping order books comfortably filled. Prices are a little stronger, and quotations have therefore been slightly marked up. Southern Iron is rather quiet, but makers are very firm, showing no disposition to grant concessions to secure further business. Good orders could be had at a slight shading of current quotations, but the furnace companies cannot be moved. Lake Superior Charcoal is in moderate demand. We quote for cash as follows:

Lake Superior Charcoal	$12 50 to $13.00
Local Coke Foundry, No. 1	11 50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

The Pittsburgh Pig Iron market has been quiet the past week. Considerable speculative Iron has been offered and the blowing in of so many Valley furnaces has increased the supply of prompt Iron very much. As a result it has declined in price. The large Steel companies are pretty well covered and will need very little Iron till after the first of the year. On the other hand, higher labor, higher Coke and higher Ore will increase the cost ot making Bessemer next year so that any material decline in the price is not probable. Foundry Irons are quiet. We quote as follows for the balance of the year, delivery f.o.b. cars Pittsburgh : No. 1 Foundry, $10.50 to $10.75 ; No. 2 Foundry, $10 to $10.25 ; No. 3, $9.50 to $9.75; Bessemer, $10.50 to $10.75.

Our Cincinnati representative writes as follows : After the flush times of the past two or three weeks, when customers were as thick and orders as frequent as could be desired, the business of the past week appears quite slow and tame. The fact is the rapid advance in Pig Iron has materially checked the buying movement, and would be purchasers for anything like round lots are holding off and fighting for some concessions. To be sure, there has been some buying, but almost entirely in a small way, with the aggregate not overly large. Opinion here varies as to the course of the market within the next week or so. There are a few inquiries for large lots, and these mainly for delivery next year. The volume of Iron consumed appears to be steadily increasing, and about the only factor which has cut much figure in making the past week a dull one is the fact that most of the furnaces are holding quite steadily to the advanced prices, with the exception, however, of some small lots. In spite of the dullness the market remains very strong and Iron masters were never in a better position to maintain the stand they have taken in regard to prices. Quotations are as follows, f.o.b. Cincinnati :

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

A steady demand has characterized the St Louis Pig Iron market during the past week, and furnaces have advanced their prices 25c. per ton. Many furnaces have their output for the next two months contracted for, and are not in position to figure on orders requiring immediate delivery, and where shipments later in the year are requested higher prices are almost invariably asked. Foundry grades are scarce, without any immediate prospect of any change in this direction. We quote as follows for cash, f.o.b. cars St. Louis :

Southern, No. 1 Foundry	$10.75 to $11.00
Southern, No. 2 Foundry	10.00 to 10.25
Southern, No. 3 Foundry	9.75 to 10.00
No. 1 Soft	10.75 to 11.00
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—A very healthy demand is in progress. Yard dealers' buying prices are as follows, Chicago delivery :

	Per net ton.	Per lb.
Country Wrought Scrap	$8.50	....
Machinery Cast	7.00	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	4.50	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.00	....
Old Boilers (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas Pipe and Boiler Tubes	5.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	9.00	....
Copper Wire and Heavy	....	10 c.
Copper Bottoms	....	9 c.
Copper Clips	....	9¾c.
Red Brass	....	8 c.
Yellow Brass	....	7 c.
Light Brass	....	4¼c.
Pipe Lead	....	3¾c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	½c.

Anthracite.—Trade continues quiet, being influenced by the mild weather. The price on carload lots of 12 tons minimum is now as follows :

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10

The Badger Brass Mfg. Company, Kenosha, Wis., have been incorporated, with a capital stock of $25,000, by C. N. Frost, R. N. Wells and G. A. Yule.

THE HARDWARE TRADE.

Trade continues without much change, there being perhaps less demand from the jobbers upon the manufacturers, the former having sufficient goods to meet their present requirements. Their stocks are, however, steadily depleting under the good demand which comes to them from the smaller houses. The changes in prices are few and unimportant, but the tone of the market continues steady and in some lines it has a decided undertone of strength.

Advices from Chicago.—Shelf Hardware jobbers report a falling off in the volume of business but in the main a fair condition of trade, far removed from dullness. The drought in some localities has cut down the demand for all kinds of goods considerably, while in other sections a better business has sprung up. It is fortunate for the country that the drought was deferred until so late in the season. Coming at this time it is perhaps doing the minimum amount of injury. An improvement in business is confidently expected to follow the appearance of the usual fall rains, cooler and therefore more seasonable weather and the marketing of the new corn crop. Manufacturers are now catching up with orders, and making much better deliveries of Hardware on contracts. Some of the Heavy Hardware jobbers report the demand a little lighter, but others so far have found no check in their trade. The movement of iron and steel from Heavy Hardware stocks has been very active during the week.

Advices from St. Louis.—The Hardware trade is now feeling the effects of the yellow fever in the South and the drought which is prevalent throughout the entire West. These two impediments to trade have had a depressing effect on business, and the hope is that both will shortly disappear. The present week is known locally as "fair week," and traveling men are nearly all in off the road, entertaining country customers who are visiting the city. Business is always moderately quiet during "fair week," and this week promises to prove no exception.

NOTES ON PRICES.

Wire Nails.—Business in Wire Nails continues good, so much so that most of the mills are fully occupied on orders and some of them have their October output disposed of. There is little change in the market so far as prices are concerned. New York quotations are about $1.70 for small lots from store.

Advices from Chicago.—An improved demand for Nails is reported by manufacturers and the largest concerns are well sold up and holding prices firmly. Some of the others, however, who are not so well supplied with contracts, have yielded slightly and prices may therefore be quoted a little lower than last week. Jobbers report a continued good movement from stock and quote small lots at $1.60 to $1.65.

Advices from St. Louis.—The demand for Wire Nails is only moderately heavy. Jobbers are selling small lots from store at $1.65, base.

Cut Nails.—The market for Cut Nails is reported in excellent condition and the mills East and West are working in harmony. The New York price is $1.53 for less than carload lots.

Advices from Chicago.—The demand is of only a moderate character and small lots from stock are selling at $1.50 to $1.55.

Advices from St. Louis.—The demand for Cut Nails has fallen off considerably, but prices remain unchanged. Less than carload lots are quoted at $1.45, base.

Barb Wire.—The Barb Wire market is in substantially the same condition as last week. The tone is good and the volume of business fair.

Advices from Chicago.—Manufacturers report a very good demand, which comes from all parts of the West. Orders are not large, but the aggregate keeps the mills quite busy. Jobbers are enjoying a fair movement from stock. Prices are unchanged at $1.60 to $1.65 for Painted and $1.90 to $1.95 for Galvanized, in small lots from stock.

Advices from St. Louis.—There is no change to note in this department. Manufacturers are only doing a moderate volume of business. The Texas trade, which is usually fairly heavy at this season, is now cut off by the yellow fever. Prices are well maintained

Smooth Wire.—The market for Smooth Wire shows no change either in prices or in the character of the demand, which continues moderate.

Plumbers' Brass Goods. While the demand in its volume is not all that could be wished, a fair amount of business is being done in this class of goods. Prices are, nevertheless, somewhat irregular and competition is active. Some manufacturers are quoting a holding up price firmly, but others are selling below what, it is claimed, the level of reasonable profits calls for, in view of the condition of the market for raw material. The general tendency of prices, however, is upward rather than in the reverse direction.

Eave Trough, Conductor Pipe, &c.—The break in the agreement of manufacturers of these materials shows no indication of being patched up. Production is considerably ahead of the demand, and the latter is merely moderate. Competition is keen and prices in consequence suffer.

Wrought Iron Pipe.—A meeting of the Wrought Iron Pipe and Tube Manufacturers' Association was held in the Monongahela House, Pittsburgh, on Thursday, September 30. There was quite a large representation of the manufacturers present, the following concerns being represented in person: Pennsylvania Tube Works, Pittsburgh; Spang, Chalfant & Co., Pittsburgh; National Tube Works Company, McKeesport, Pa.; American Tube & Iron Company, Youngstown, Ohio, and Middletown, Pa.; Morris Tasker & Co., Philadelphia; Riverside Iron Works, Wheeling, W. Va.; A. M. Byers & Co., Pittsburgh; Oil City Tube Company, Oil City, Pa., and Ohio Tube Company, Warren, Ohio. Frank J. Hearne of Riverside Iron Works was president and Joseph Brown of Pittsburgh secretary. The meeting was called for the purpose of considering fully the present condition of the Pipe and Tube trade and to consider the advisability of making an advance in prices. After a careful and thorough discussion of the situation it was decided to make a slight advance in prices and the base discounts were changed as follows: Butt Weld Black, 72 per cent. discount; Butt Weld Galvanized, 67 per cent.; Lap Weld Black, 78 per cent.; Lap Weld Galvanized, 70 per cent. The above discounts are subject to a further discount of 10 and 5 per cent. for carloads and 10 and 2½ per cent. in less than carloads. On carload lots there is a freight allowance, but in less than carload lots there is no freight allowance. The discount on Screw and Socket Casings was put at 65 per cent. and on Inserted Joint Casing at 60 per cent. The present condition of the Pipe and Tube trade is referred to by the manufacturers as very satisfactory, there being quite a good demand and the mill very busily employed. The principal reasons given for the advance in prices are the higher prices of Iron and Steel Skelp, and the fact that a number of the concerns have recently advanced wages 10 per cent. and others will probably do so in the near future.

Glass.—The end of September saw the general resumption of the American Glass factories apparently no nearer than at its beginning. Manufacturers are still working upon the formation of a single Glass association, and allow the factional fight among the workmen to prevent them coming to any wage agreement. Small sizes of Glass are scarce. New York jobbers' prices for American Window Glass are 60 and 10 and 5 per cent. discount, and for Imported Glass 85 per cent. discount from the new list published last week, and which goes into effect October 11.

White Lead.—Base material has declined in price slightly. Linseed Oil has also fallen. To this extent market conditions are somewhat weaker. Corroders have made no concessions on either Dry Lead or on Lead in Oil and manufacturers of the various mixtures have deviated very slightly from the prices that they have been quoting for a considerable time past. Jobbers, too, are holding to list prices in about the usual way.

Red Lead.—Nothing more than ordinary business has been effected in Red Lead, and prices are without important change.

Linseed Oil.—There has been a further decline in prices of domestic seed product and the market is still in a very unsettled condition. Sharp competition between conflicting interests and a quite heavy decline in prices of raw material are accountable for the weak condition of the market. Within a few weeks the price of domestic seed has fallen about 10c. per bushel.

Spirits Turpentine.—Dealings have been quite large in the Southern markets and fairly active here. Prices for retail lots moved up steadily and are now at about 35½c. in barrels and 43c. in cases.

George H. Laib, for the past 15 years with the Ahrens & Ott Mfg. Company of Louisville, Ky., and John F. Hazen, Jr., formerly with the John F. Hazen Company and Rogers, Brown & Co., Cincinnati, Ohio, have formed a copartnership as Iron and Steel factors with office at 802 Neave Building, Cincinnati. The new firm will represent leading Iron and Steel manufacturers, among whom are the Riverside Iron Works of Wheeling.

Lead Pipe in Japan.

A recent issue of the *Japan Weekly Times* contains the following : There is a constantly increasing demand in Japan for lead pipes of various sizes, for water, gas and other purposes. Hitherto the chief supply has been drawn from two factories in England and one in France, though of course there are many others in Europe and America. Wakayama Genkichi, formerly in the mechanical department of the Admiralty, is said to have succeeded in setting up a pipe making plant in Japan, after years of industrious attempts and investigations. Pipes of his manufacture have been tested by the Osaka Water Works authorities, with such great success that it has been determined to establish the manufacture of lead pipes on a large scale in Tokio, with a branch also at Osaka.

A Century of Gas Lighting.

A lectnre was delivered in the Public Hall, Belvidere, England, by A. H. Bateman, on the progress of gas lighting during the past hundred years, of which a London gas journal gives the following summary :

Mr. Bateman divided his subject into four sections, dealing respectively with the history, chemistry, manufacture and use of gas. In regard to the first, he described the circumstances under which William Murdoch discovered the illuminating value of the gas resulting from the carbonization of coal. Like most other discoveries, however, its practical application did not, he said, come till long afterward. Having alluded to the work of Lavoisier, Priestley and others, in connection with gas, the lecturer passed on to describe Murdoch's improvements in lighting by means of this illuminating agent, and also those of Winsor. Coming down to 1812, when the National Light & Heat Company were formed, and granted a Royal charter, he traced the further progress of the invention, and the lighting of Westminster Bridge, St. Margaret's parish, the City of London, South London and all the large provincial towns, during the following years. The subsequent history of gas lighting had, he said, been merely improvements of detail Clay retorts had replaced iron ones ; more pains were taken with purification ; and exhausters were largely used. Most important of all the later discoveries was the value of the residual products, and the extraordinary series of coal tar derivatives. Reference to these matters naturally led the lecturer on to the second section of his subject—viz., the chemistry of gas manufacture. He showed that this consists in taking to pieces, so to speak, the materials composing coal, and producing therefrom crude, and finally purified gas. Upon the complete evolution of the latter from the former depends, he said, the quality of the distributed article. But, even in its purified condition, it was still a complex fluid. The great thing was to get rid of the obnoxious properties of gas. Sulphureted hydrogen was a specially unpleasant one, and therefore every effort was made to remove it before the gas left the works. Ammonia, on the other hand, was a very valuable constituent, the extraction of which was beneficial to the undertaking, as it was an appreciable source of income. With reference to the process of gas manufacture, which, the lecturer pointed out, must go on continuously, as the cessation of the supply of what had grown to be a common necessity would result in little less than a social cataclysm, the whole of the operations were explained by means of a small model. Commencing with the placing of the charge of coal in the retorts, he traced the gas through the condensers, washers and purifiers, till it finally reached the holder—each appliance being described as he went on. Having conveyed the gas so far, Mr. Bateman gave his audience some information as to the arrangements for testing its quality, and also as to how to use it. He stated that, as a matter of fact, it was a most exceptional thing to find any gas sent out which was not of a perfectly satisfactory quality, and the complaints frequently heard about bad gas were almost entirely due to the extraordinary indifference of the public as to the mode of consuming it. While people recognized the importance of having good grates in which to burn their coals, they were at the same time apparently satisfied with any sort of burners for their gas. and allowed them to be used until they were perfectly worthless before having them replaced. The result was that the good gas made by the companies yielded bad light, owing to the stupidity of most consumers. There was possibly some excuse to be found in the disappointment often experienced from the purchase of so called wonderful burners sold by traveling salesmen. most of which turned out to be worth very little. It could not, however, be too strongly impressed upon the gas consumer that a shilling or two spent on a good burner would save 10 shillings in the course of a year. There were, he said, many excellent burners to be obtained, and he exhibited several specimens and explained their construction. Ordinary gas, as supplied to the general public of Great Britain, gave a light of about 1½ candles per cubic foot when consumed with a common burner ; but with a better class of burner this quantity of gas would give a light of 1¾ or even 2 candles, or with governor burners from 2½ to 2¾ candles. It was, therefore, easy to see how a consumer could nearly double his light, if he only paid attention to his burners. For lighting on a larger scale, and with more expensive burners, a much higher illuminating power could be obtained. The Welsbach incandescent gas light, while requiring some care in using, gave a bright light of 8 to 10 candle-power per cubic foot of gas ; and where regenerative lamps could be employed upward of 10 candles were obtainable from this quantity of gas. Mr. Bateman then referred to other uses for gas, such as for cooking, warming and motive power.

The American *Review of Reviews* for October contains an interesting article entitled "Aluminum: A Newcomer Among Metals," giving the history of the introduction and development of the American process for the manufacture of aluminum and a description of the aluminum works at Niagara Falls, N. Y., and New Kensington, Pa.

Sidney Shepard & Co., Buffalo, N. Y., are introducing what they term Brilliant metal flux for the use of galvanizers. A descriptive circular has just been issued which describes their product. It is an alloy containing the proper percentage of aluminum to produce the best results in the galvanizing bath.

Write at Once for Particulars.

C. BARSTOW, No. 10 Huron St., Grand Rapids, Mich.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

STREATOR, ILL.

—"THERE is no man in Kansas quite so scientific and methodical in his methods of procedure as ex-Chief Justice David Martin. Yesterday he took Topics into his confidence in relation to a trip to Klondike, which he has in contemplation. He has investigated the subject, and finds that a polar bear can go nine months without any food whatever, existing solely upon the fat which he has accumulated upon his bones during the summer. He finds further that the bear wastes away only about one hundred and twenty pounds during this period of starvation, and he figures that he has upon his own person about one hundred and fifty pounds of fat that will enable him to go longer without food than any bear that ever lived. 'The whole problem in Klondike,' said the amiable ex-Chief Justice to Topics, 'appears to be the question of food. I can stay one season without a bite to eat, and come back with a pound of gold for every pound of fat I carry in.'"—*Kansas City Journal.*

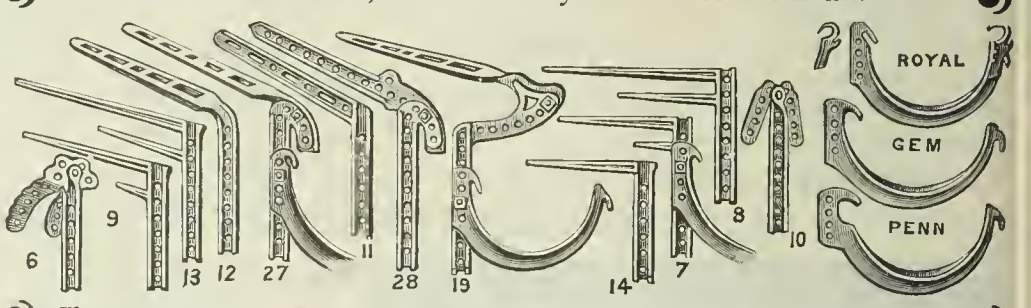
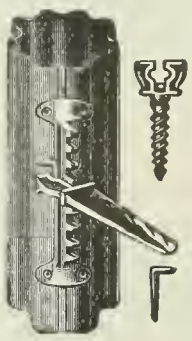
Maiden Aunt (bitterly)—I shouldn't judge by appearances—men are so deceitful.—*New York Press.*

Berger's Gutter Hangers.

Tinners can find among our complete line a style of hanger to suit any kind of roof; it only requires the proper selection. Attention is called to the **Hinged Shanks,** made for any pitch roof. All are strong and easy to put up, leave a free open gutter, and are neat in appearance. No. 34 is specially made to hang gutter to corrugated iron roofs and awnings. Send for our **HANGER CIRCULAR,** which clearly illustrates them all.



Every customer who uses the Gem Circle should ask for a free sample of the new Royal Circle with next shipment.



B. B. Pipe Fasteners

are so simple, so good and so cheap that there is no excuse for using a poor one. We will convince you if you will write for a free sample.

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

—How Times Have Changed.—The time was, and not many years ago, when a member of either branch of Congress who referred to the other branch by name would have been promptly called to order. In the Senate it was and still is usual to refer to the House of Representatives as "elsewhere," but it was not then in order to criticise "elsewhere." In the House of Representatives the Senate was always delicately referred to as "another place." But times have changed, indeed. It is well known to everybody in Washington that "strained relations" now exist between the co-ordinate branches of Congress. Mr. Cannon, of Illinois, addressing the House, bluntly referred to "the Senate, which is 'No Man's Land,'" and Mr. White, of California, addressing the Senate, referred to "the legislative padlock which forecloses action elsewhere." Fancy Daniel Webster or Charles Sumner rising in his place in the Senate and referring to "elsewhere" in such terms; or fancy Justin S. Morrill rising in his place in the House of Representatives thirty-five years ago and saying: "The Senate, which is 'No Man's Land.'"—*N. Y. Tribune.*

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V. BURR.

166 pages, illustrated throughout, cloth, price, **$1.00.**

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing, Drilling Rims.
Chapter VIII.—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending,
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Annunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.
Chapter IX.—Running Wires in Finished Buildings.

Instructions on Joint Wiping

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, 25c.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

G. E. BISHOP, - - Dowagiac, Mich.

—It was evident that the gray-haired old gentleman was put out about something. "Yesterday," he said, "I heard you refer to me as 'the old man.'" "Very likely," replied the young man. "Well, I don't like it," returned the old gentleman. "I suppose you meant nothing wrong, but it is disrespectful. I have always tried to be fair and considerate with the boys in the office, and I don't like to be repaid in this way." "Did you ever know of any one who was unpopular being called 'the old man?'" asked the young man. "Eh? What's that?" demanded the old gentleman. "When a man is known through an office as 'Mister,' isn't it a 10-to-1 bet that he is pretty generally disliked or feared?" The old gentleman thought it over for a minute. "Perhaps," he said, "in view of my own recollections of an 'old man' and how I regarded him I'd better withdraw any objections to the term."—*Chicago Post.*

—Was a Cold Day For Him.—"What is the cause of your confinement?" asked the inquisitive visitor to the prison of the interesting-looking convict.

"The climate," replied the striped one.

"The what?"

"The climate. I froze on to a bicycle that didn't belong to me."—*The Wheel.*

A TESTIMONIAL.

From BEALL, BROS.

ALTON, ILL., April 10, 1896.

In reply to yours of 8th inst., will state that the large press you made us for the manufacture of goods in our line (pick-eyes) gives us entire satisfaction and more than meets our expectations. If needing anything in your line you can rest assured we will correspond with you.

MAY 1, 1896.

Our machine is working perfectly in every respect, and we are making from 1,200 to 2,000 pick-eyes a day, and it gives us no trouble whatever. We occasionally break a punch, but that can be changed in a few moments' time, as we have some made up, and all we have to do is to take out the old one and put in a new one.

Correspondence Solicited.

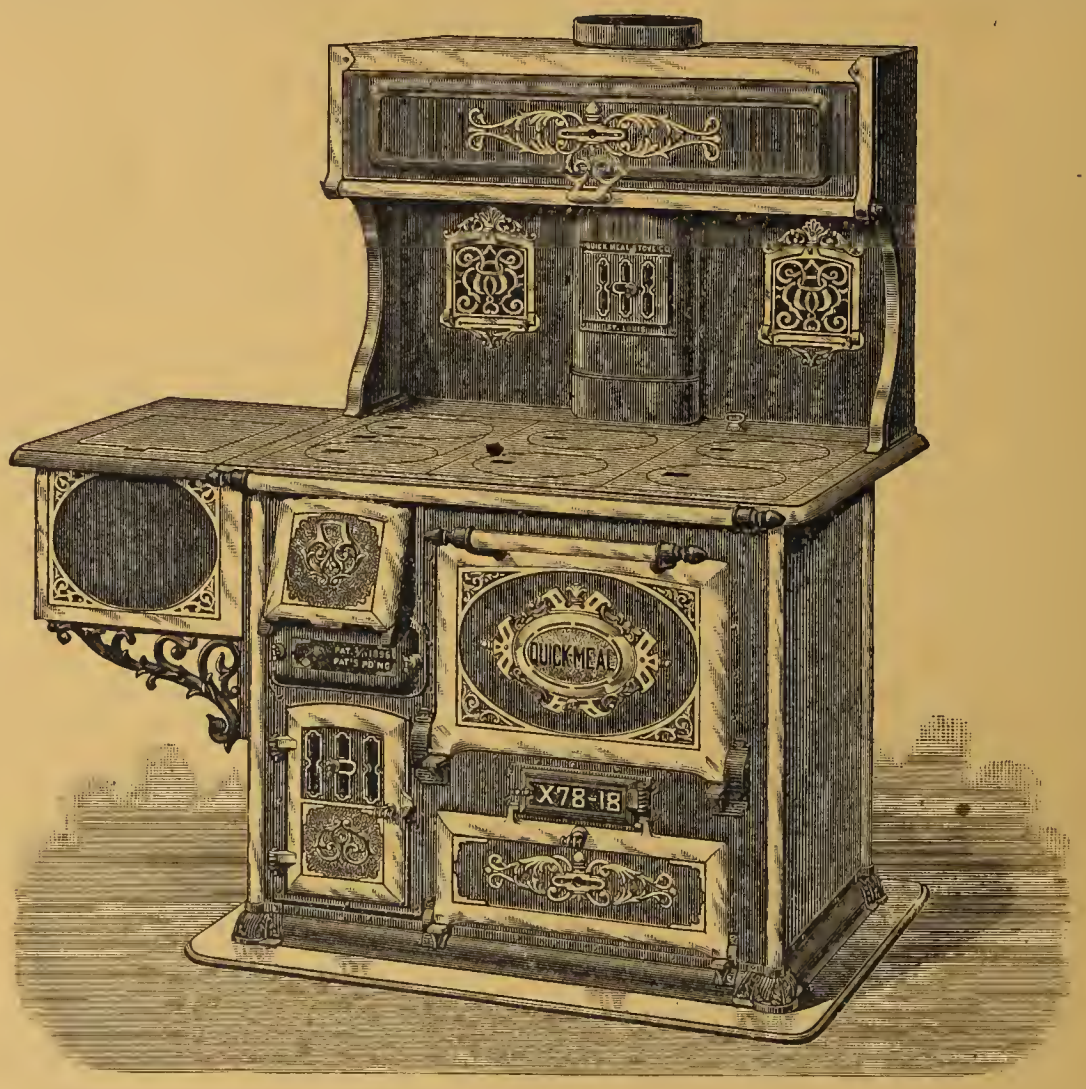
MAGEE FURNACE CO., Boston, Mass.

QUICK MEAL

STEEL RANGE.

THE NAME TELLS THE STORY OF ITS CONVENIENCE.



The "Quick Meal" is built unlike any other Steel Range. It could not be the "Best" if it were made in the old-fashioned way like other Ranges. The design, workmanship and finish of the "Quick Meal" amply prove this.

The "Quick Meal" is not painted. It is finished in enamel and baked in a kiln at 300 degrees heat. The asbestos lining, throughout the Range, varies in thickness from one-quarter to three-quarters of an inch, and which is all encased within heavy walls of steel. This preserves the Enamel and the bright and smooth Finish remains for a very long time.

The "Quick Meal" is built on the interchangeable plan. Any part can be easily duplicated and readily put in place, should it ever become necessary. This is an immense advantage and found only in the "Quick Meal."

The "Quick Meal" has many other exclusive features, any of which make it an easy leader in the trade.

COUNTER BALANCE

Spring Regulator,

FOR HEATING APPARATUS.

This Regulator requires ONE chain each for the Check Damper and Draft Damper. Each chain is coiled on a spring balance, which has a tension equal to the weight of the damper. The tension can be altered to suit varied conditions.

The chains *operate independently of one another* to suit varied conditions of draft. With some Regulators a continuous chain is used, and the draft damper cannot be altered with corresponding reverse action on the check, whether desirable or not. This Regulator obviates that result. It can be located in the first or second story of the building.

It is finely finished and handsomely nickeled, has a thermometer in its face, and is as ornamental as it is useful.

This device, with 12 feet of chain, is furnished without additional cost with

Economy Heaters and Furnaces.

The retail price for extras is $2.50 each.

THE FORBES WARM AIR FURNACE.

PHILADELPHIA, April 10, 1897.

Messrs. TUBULAR HEATING AND VENTILATING CO., 228 Quarry Street, Philadelphia.

GENTLEMEN:—The Forbes Warm-air Furnace placed in my house last fall has given me entire satisfaction.

During the greater part of the winter the house had to be kept at a very high temperature, owing to illness in the family. Your furnace did all it was called upon to do, and on a remarkably small amount of coal.

Last winter a furnace of a popular make failed to even warm the house comfortably, and burned fully 50% more coal.

I think your furnace is all you claim for it, and do not hesitate to recommend it to any one desiring comfort and economy. Very truly,

5027 Florence Avenue. M. J. FALLS.

STOVE MERCHANTS

who have visited our various show rooms for the first time are surprised at the enormous variety of goods to be found in the *Acorn Line*. A prominent stove merchant who sells Acorns recently desired to increase his assortment, and was amazed to find he could do it and still confine his purchases to Acorns.

It is difficult to realize that any one concern can supply a line of specialties *to suit the peculiar wants of any section*, but we can do it with the *Acorn Line*. In addition, every pattern is bright, new and up to date—and in competition with other goods will win out every time.

Don't run away with the idea that because *Acorns are better* than other goods they are higher in price. Find out about it. Tell us what goods you want prices on, and by return mail we will quote you some figures that will *get your business.*

CHARTER OAK STOVES

Monarch Blue Gas Flame Oil Heating Stove.

The phenomenal success of the "Blue Flame" Oil Burner of the past two years has created a "Macedonian Call" for a heater made on the same lines, and the "Monarch" steps forward to supply the demand. It has been on the market one year, and for the season of 1897-8 is presented with several important improvements which a year's experience has suggested and we offer it with all confidence in its efficiency, cleanliness, intense power and great comfort.

There are no others with Blue Flame.

Top tilts back to light the Burner or to remove the Tank. Mounted on Casters. The entire Stove is richly nickeled and beautifully polished. Brass Tank. Burner cannot creep up. Will not smoke or smell. There is only one "Blue Flame" Heater and that is the "Monarch."

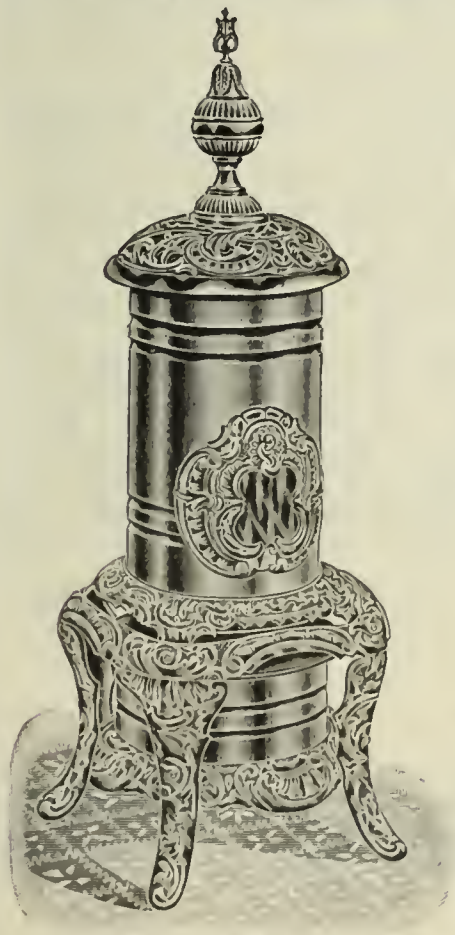
ELECTRIC OIL HEATERS.



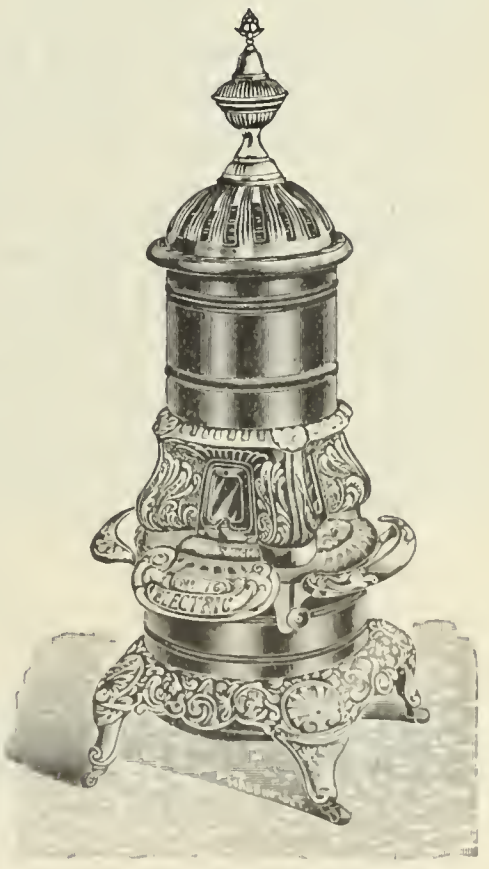
Made in 3 Styles.

Artistic Ornamentation.

We wish to call particular attention to the Air Circulation and Expansion, Radiation, etc., as involved in the construction of the **ELECTRIC**, as compared to the interior arrangement of certain oil heating **LAMPS** placed on the market under the misleading appellation of Oil Heating **STOVES**, illustrating the audacious assumption of the manufacturers in claiming such distinction.

The **ELECTRIC** has the **greatest radiating surface** and its **heating capacity** is greatly **increased** by the application of our **ventiduct principle**, involving **four hot air flues** which take up the cold air from the floor and pass it through the stove and out at the top, heated to a high degree.

Graceful and Symmetrical in the Highest Degree.



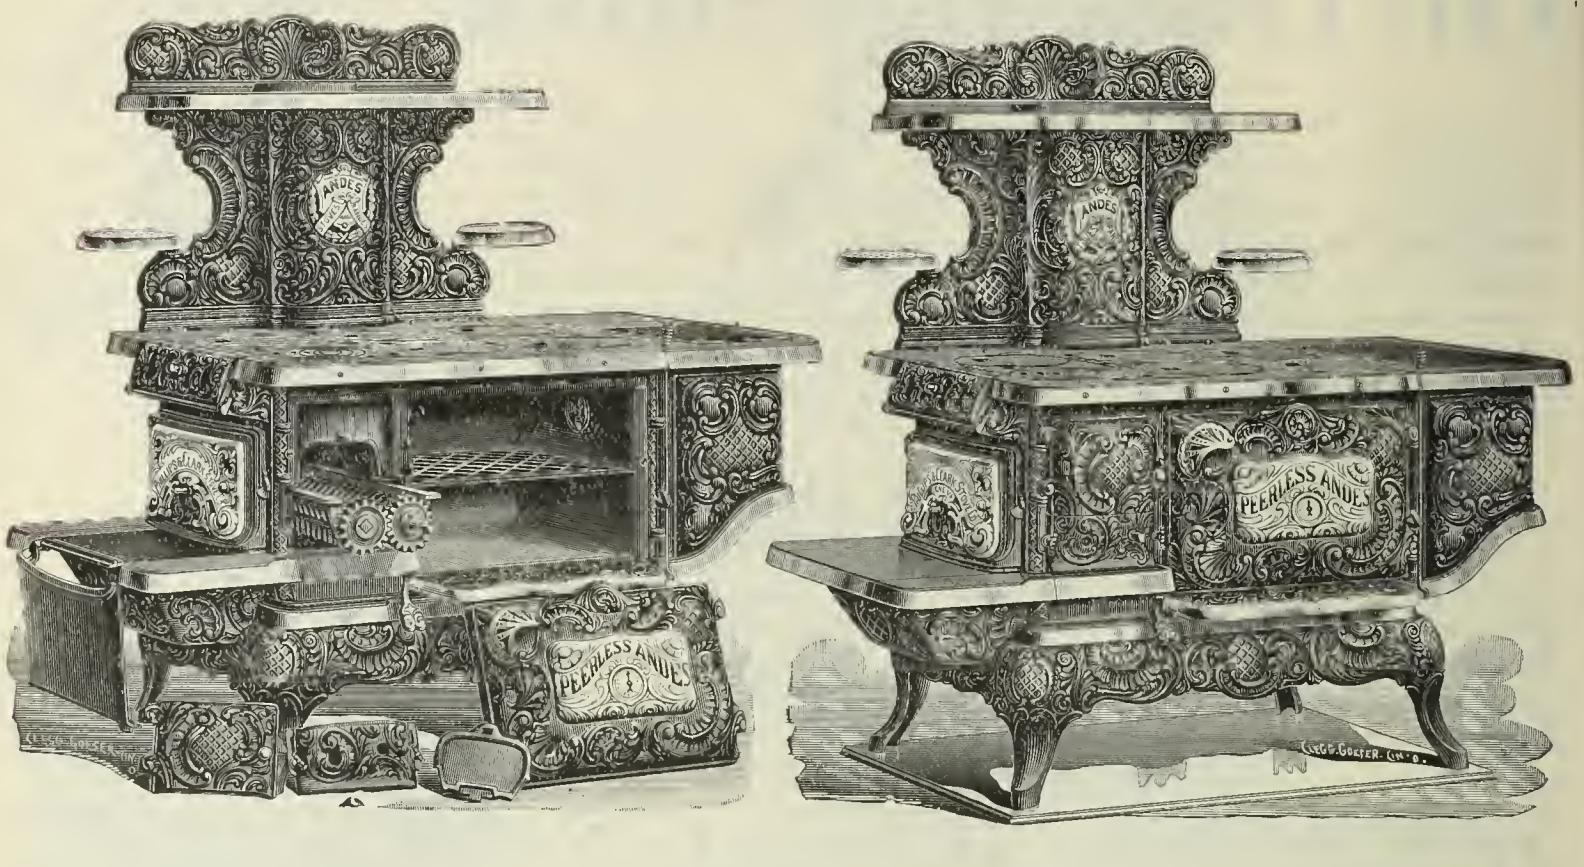
Made in 2 Sizes.

Perfect Proportions.

Send for Catalog and Discounts of the most complete line of Oil Stoves manufactured.

ELECTRIC OIL STOVE CO., - - HOMER MICH.

Peerless Andes.



Entirely New. *Finest Range Ever Made.*

WE present the latest addition to the ANDES line of Stoves and Ranges. As will be noticed from the above cut, the design is bold, up to date, and strictly correct, artistically considered. This range is unusually large in every way. It has every improvement which is at all desirable. The oven is very large and well ventilated; heated on five sides The ash pan is unusually large. The fire box is a new and improved form, perfect in its fittings. The grate is of our own improved style of draw out form, together with our own patent arrangement for taking out the single bars without removing the fire box. The entire grate can be drawn out without removing the fire box. The wood fixtures for this range we claim to be better than any heretofore made. The reservoir is unusually large. The oven door, as is shown in the above cut, has the best form of oven thermometer made. The top oven plate is cemented. The bottom of the stove is double. The back of the oven is double. An elegant nickel band on the edge of the main top, and also on the edge of the high shelf. Reed's patent check damper. Towel rod. Elegant plate panels. In every respect this range is as good in design, form, weight, quality of castings and mounting as can possibly be made. We predict for this range a successful sale. The prices will be right. The No. 9-20 size is now ready.

MANUFACTURED BY

Phillips & Clark Stove Co.,

Geneva, New York.

Oak Andes.

MADE IN FIVE SIZES.

WE present above a cut of the OAK ANDES for 1897. As will be seen, it is entirely different in design from any other, and in construction it is entirely original. The sale of this stove for the year 1896 exceeded by far the most sanguine expectations of the manufacturers, and it is predicted that it will be one of the most, if not the most satisfactory selling stove on the market the present year. It is peculiar in that it has a distinctively original jointless air tight bottom, entirely different from any other, and for which letters patent are pending. It is claimed to be the strongest Oak Stove bottom on the market. The register damper used in this stove is on the inside, making a much better finish on the exterior than if otherwise. The damper is ground in emery by day labor, thus insuring a perfectly air tight joint. It is unquestionably the best air tight damper made. The fire pots in the OAK ANDES are heavier than any other, thus making the stove more durable. We use the best quality of No. 14 Steel in the bodies. The grates, both wood and coal, are the most approved form; the coal grate being the thoroughly tested draw center pattern, the wood grate being the register pattern. The dealer who wishes to handle the very best stove on the market, and at prices suited to the times, should make application for the sale of the OAK ANDES.

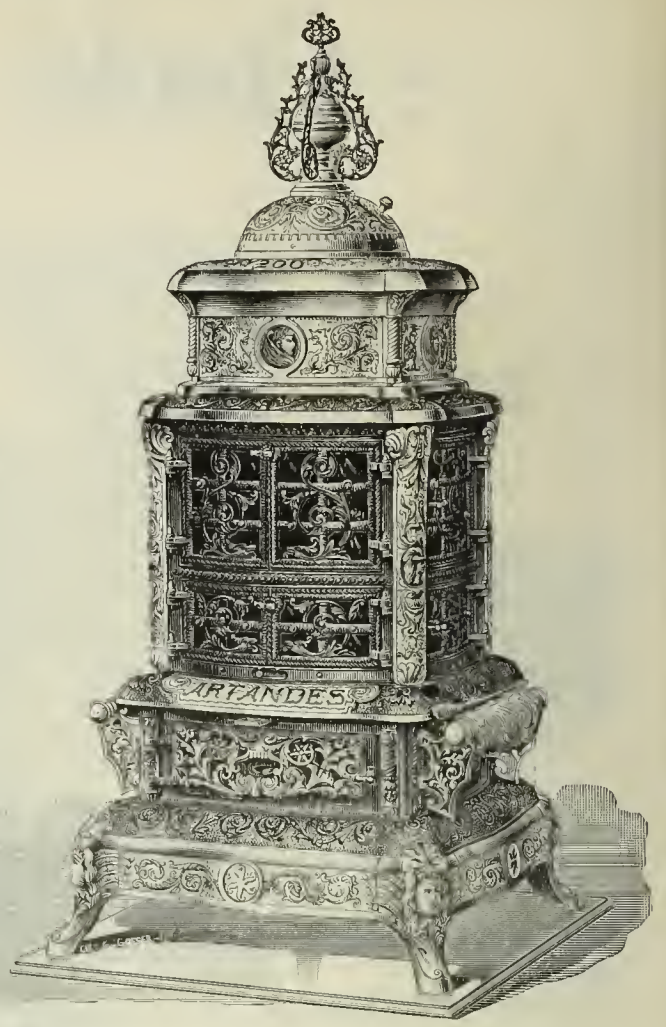
Art Andes.

TWO SIZES.

No. 2. Size of fire-pot 14 inches.
No. 3. " " 16 "



Art Andes.

THREE SIZES.

No. 180, Size of fire-pot 14½ inches.
No. 200, " " 16 "
No. 22, " " 17½ "

WE BELIEVE it is generally conceded that no better first class Parlor Heating Stoves have ever been made than the **Art Andes,** two styles of which are shown above. No question but that there is more satisfaction to the dealer as well as to the consumer in selling and using the best article. The quality is unquestioned; the design is attractive, and in good taste, and the operation has always been entirely satisfactory to the consumer. We would recommend these goods in preference to cheaper ones; more satisfaction in handling and using them.

Magic Andes.

No. **11,** Size of fire-pot, 11 inches.
No. **13,** " " 12½ "
No. **15,** " " 14 "

ABOVE are shown a few of the medium and lower grade **Andes Heating Stoves.** Other varieties are manufactured, but these cover all the requirements of any market. Every **Andes** stove is a perfect article: they are all made of the same material, the best that can be purchased. Every piece of casting is thoroughly inspected, and no smoother stoves are made than those bearing the name "**Andes.**" The quality of the mounting is first class, as good as the best mechanics can produce. The designs, it will be observed, are carefully looked after in the cheaper grade of "**Andes**" as well as in the higher, and the operation of these stoves is all that can be desired. The dealer wishing the most satisfactory line of goods to sell can find such in the "**Andes**" to better advantage than in any other line of stoves and ranges made.

THE ranges bearing the name "**Andes**" have the enviable distinction of carrying off the palm for performing the greatest baking feat ever accomplished. There is no better baker than the **Grand Andes.** Any who are acquainted with this range will acknowledge that it is unquestionably as neat and attractive a design as ever presented; that it is a perfectly proportioned range; that it is made of selected castings as smooth as can be made in iron. The mounting is first class and the operation has always been perfectly satisfactory to the consumer. There is nothing in the **Grand Andes** but that is strictly first class, and we claim that at the price this is the cheapest range on the market.

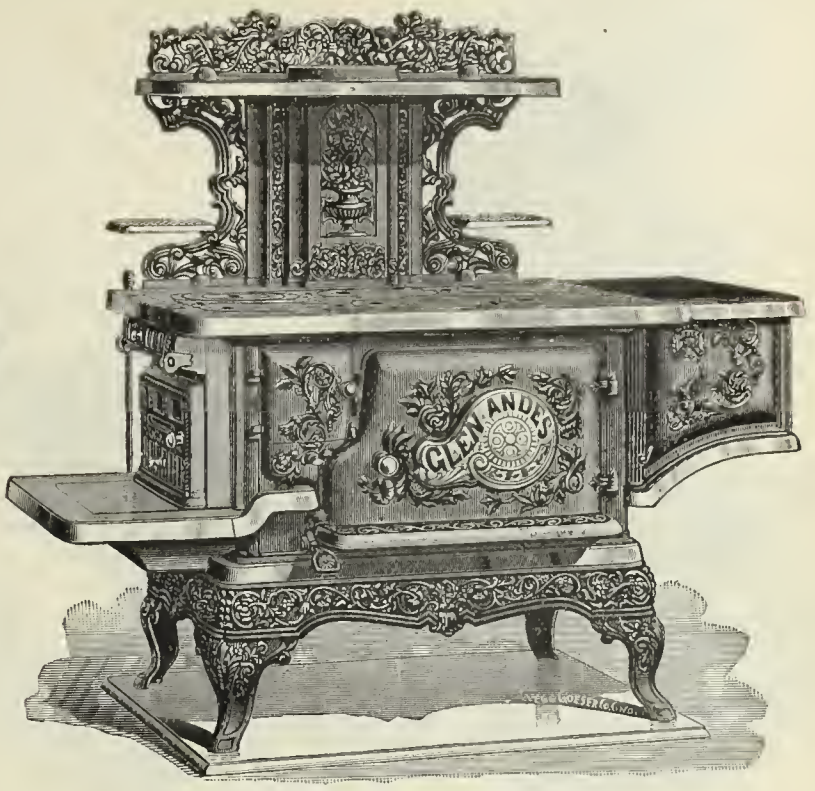
No. **9-20,** 9-in. " " 20 x 20 "



Glen Andes.

SIX-HOLE. For Any Kind of Fuel.

No. **8-18,** 8-in. holes, Oven 18½ x 19½ inches.
No. **8-20,** 8-in. " " 20 x 21 "
No. **9-20,** 9 in. " " 20 x 21 "

THE above six-hole ranges, together with those of higher price, make up a line of six-hole ranges under the name of "**Andes**" which will meet all requirements. They are all attractive in appearance; all made with care; all perfect workers, and every one will give perfect satisfaction. The range of price will enable the dealer to meet all demands on him. There is nothing lacking in the "**Andes**" line to suit the most particular buyer.

No. **8-20,** 8-in. " " 19 x 20 "
No. **9-20,** 9-in. " " 19 x 20 "

FOUR-hole ranges have demanded of the manufacturers more care and attention than heretofore, and we herewith on this and the following page present a line of **Four-Hole Ranges** which for style, design, quality, size, and price cannot be excelled. They range from the very best grade to the cheapest, although we claim that the "**Active Andes,**" which is our lowest priced range, is the best range ever offered to the trade at the same price; there is nothing cheap about it except the price. These ranges will do just as much work as the larger and more expensive goods, and the quality of these four-hole ranges is first class and will sustain the high standing of every article heretofore made and bearing the name "**Andes.**"

MANY wonder what has made the "**Andes**" goods so widely known, extensively sold, and so universally popular, and it can be briefly stated that, first, the quality of the goods; second, good value at a reasonable price.

Our agents are presenting the merits of the "**Andes**" line to our regular customers, and will be pleased to call on any others out of the regular route. We solicit correspondence, and can assure the buying public that their requirements can be better met and their necessities better served by buying **Andes Stoves and Ranges** than any other.

Reliable Steel Ranges

Made in a Reliable Factory by Reliable Manufacturers known the world over for making only Reliable goods, and are handled by all Reliable Stove Dealers, are purchased by Reliable People. If you have a RELIABLE, your servant will be reliable, as it is a pleasure instead of a task to do all kinds of culinary work with a RELIABLE after using any other make of range.

There are a few other well made and well finished ranges on the market, "But not so many," and none of them equal the "RELIABLE."

A FEW RELIABLE FACTS.

The Best Proportioned Range!
The Most Highly Finished Range!
A Range Constructed of the Highest Priced Patent Leveled Wrought Steel.
Our Fire Box Linings for 1898 are the heaviest placed in any range!
Our tops will never crack from heat!
The RELIABLE is the best made, costs more to make and is the most popular range of the day!
Also made in the combination style for coal, wood, manufactured and natural gas.

ARE DURABLE.

Office of
E. D. F. Brady,
Attorney at-Law.

Washington, D. C., June 8, 1897.

Superior Foundry Co.,
Little Falls, N. Y.

Dear Sirs:—I take pleasure in stating that the "Superior" Hot Air Furnace which I had put up in my residence in Garrett Park, in 1891, has given in every respect. the fullest satisfaction.

For heating capacity, durability, and economy of consumption of fuel, I think from my experience I can state your furnace has no superior. It has been in constant use every winter from October, 1891, has done its work most satisfactorily, and no part of it has broken or been burnt out. Since you placed it in position I have not been under one cent's cost for breakage or repairs of any nature.

I will add that many friends of mine, who, upon my recommendation, have had your furnaces put in their dwellings, have spoken of them in the highest terms. Yours truly,

E. D. F. Brady.

WOOD FURNACES

OUR IMPROVED MONITOR.

With DIRECT and INDIRECT DRAFT, is made in two sizes for Brick or Galvanized Cases.

No. 38 burns 3 ft. wood, No. 50 burns 4 ft. wood.

The fire-box is made of cast iron, **corrugated** very **heavy** and **substantial.** The dome and radiator are made of **heavy plate** iron (gas tight).

This furnace can be set in low cellars and is easily put into old brick work. With smoke pipe removed, radiator can be cleaned thoroughly in five minutes, by means of clean-out door in front.

Simple to manage and most economical in fuel, with an immense heating power.

We also make the **CLIMAX and HOT BLAST WOOD FURNACES,** the best of their kinds at a lower price. Thousands in use in all sections of the country.

Testimonials and full particulars sent on application to the manufacturers.

THE METAL WORKER ESSAYS —ON— HOUSE HEATING —BY— Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculatiou upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method aud goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will bo found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages iu tho form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilatiou aud economical arrangement of pipes and radiators, &c. Tho very completo specifications of materials which accompany several of tho essays give a value to the work that will be understood and appreciated by the architect aud builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

407 pages, 7 x 9½ inches. Handsomely bound in cloth. One volume.

PRICE, $3.00.

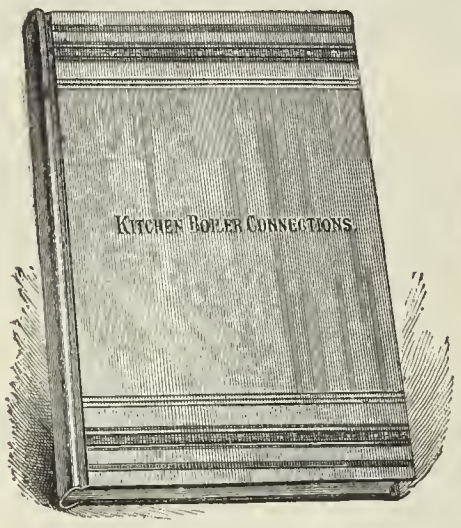
Sent Post-paid on receipt of Price by

DAVID WILLIAMS COMPANY,

PUBLISHERS,

232-238 William St., New York.

KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

STEAM
AND
HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

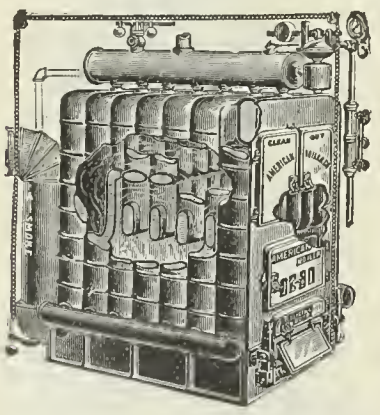
Quick Steam.

The immense amount of self-cleaning fire surface, well applied to the fire, and the directed circulation of the water over all the heating surfaces, enables the

"American" Steam Boiler



to generate steam quicker, to hold it longer, and evaporate more water for every pound of coal consumed than has ever been accomplished in any similar construction of steam-heating boiler. If you know the "American," and the similars, you know we're telling the truth.

—"Some time ago," says a man who always trles to heed good advice, "I stopped eating hearty dinners on the advlce of an eminent physician, who said that a hearty dinner tended to shorten life. Not long afterward I saw that another physiclan, equally eminent, sald it was simply suicidal to eat a heavy luncheon, and so I made an apple or a cracker serve me for luncheon. It was pretty tough to get up from luncheon and dinner in a famished condition, but I consoled myself with the thought that I was lengthening my life. And, besides, I could eat a hearty breakfast. But the other day I saw that still another eminent physician says that no one who wants to live long should eat any breakfast, and I am puzzled to know what to do. These men are experts, and presumably know what they are talking about. But if I adopt their directions for the attainment of a long life it looks as if I might die of starvation in less than a month."—*New York Tribune.*

—He Took a Great Risk.—It is currently whispered that Mrs. ——, while cleaning house, asked her husband to nail up some [ ]. He refused. She looked †† at him, told him his conduct was without a ||, beat him with her ☞ untll he saw **. He now lies in a ,tose state and may soon be a fit subject for diss. A man must be an * his life in that way and put a . to his existence.—*Exchange.*

—Two Turks were at a French banquet. Toward the conclusion of the feast a Frenchman selected a toothpick from the tray near him and politely passed the tray on to his neighbor, who, however, peremptorily declined the offer, exclaiming: "No, thank you! I have already eaten two of the accursed things, and I want no more!"—*San Francisco Argonaut.*

—A BRAWNY SWEDE visited the City Hall the other day to procure a marriage license, and a couple of clerks to whom he innocently stated his wishes directed him to the department where dog licenses are issued. He approached the license window diffidently, gave his name and address and asked what the document would cost. "It will cost you $1 a year for every dog you keep," replied the clerk.

"Dog?" echoed the Swede.

"Why, certainly," continued the clerk, "don't you want a dog license?"

"Val, no," cried the would-be benedict. "Ay kaint afford to buy a dog dees yar. Ay vant to get only a vooman now."—*Chicago Times-Herald.*

BUY ONLY THE AMERICAN

—A REMINISCENCE.—Says an old New York merchant: "When the late Alexander T. Stewart set out to destroy rivalry in trade he succeeded in doing it. I remember one incident which illustrates my point. Thirty years ago, when Mr. Stewart had just finished his big building on Broadway, which occupies an entire block, bounded on the east by Fourth avenue, on the south by Ninth street, and on the north by Tenth street, his success aroused the envy of a Chicago man named Sherwin, who came to New York with the avowed purpose of running out A. T. Stewart. So Sherwin hired a big store on Fourteenth street, west of Broadway, extending through to Thirteenth street, which he fitted up 'regardless of cost,' and christened 'The Maison d'Or,' meaning the 'House of Gold.' Mr. Stewart watched these preparations grimly. When Sherwin was finally ready to open his doors to customers he was permitted to enjoy one day of uninterrupted trade. But the next morning he saw the crowds rushing past his doors and flocking to A. T. Stewart's big store. What was the reason? Nothing, except that Mr. Stewart had reduced his prices 33 1-3 per cent. on everything in his great mart. And this, mind you, was in 1867, when we were in the flush of war prices. Poor Sherwin was forced to follow suit. But he had bought when things were high, and was so poorly prepared to sell when things were cheap that at the end of eight days he was compelled to shut up shop. Then Alexander T. Stewart smiled sardonically as he directed his subordinates to add one-third to the price of each article offered for sale. Nothing more was heard of Sherwin in New York City."—*The Buyer.*

"MY GOOD MAN, do you ever do anything to bring light and purity into the homes of your fellow-men?"

"Yuss, lots."

"You distribute tracts?"

"No; I cleans windows and beats carpets."—*Illustrated Bits.*

PATENT PENDING.

DIRECTIONS FOR USING.

Place the arms 3 in flue hole, leaving lugs 5 and ring 1 close to outside surface of chimney, insert stovepipe as usual. As stovepipe enters flue hole, lug 5a catches on inner surface of chimney. Turn thumbnut 8 until ring 1 is tight around pipe. Push collar to accustomed place and the entire lock is out of sight.

Packed, 1 doz. in nicely labeled box.

Send in your orders at once. Set the pace rather than follow the other fellow. The cost is but a trifle.

No more cussing on account of stovepipe.

The Business Situation.

The past week has been rather more quiet, in a business sense, than its predecessors, taking the general trade throughout the country. In a number of wholesale lines a diminished activity is noted, which is usual at this period of the year. Winter business is on the wane and merchants are hardly ready as yet to place orders for spring goods. Probably the volume of business will not total up as large a figure as has been reached in recent weeks. Nevertheless, reports from the retail trades show that manufactured goods are moving briskly into consumption, especially in the West, where the breaking up of the drought, with the occurrence of much needed rains, has stimulated trade considerably. Industrial activity in the country at large is also on the increase, and manufacturers generally are exceedingly busy filling orders and making up stock. Only in the South is there a decided check to the free interchange of commodities, owing to the yellow fever quarantine. Aside from this untoward incident, however, the influences governing business remain favorable. The Government reports of international trade show that exports from this country are breaking in volume and value every past record. The growth in this respect, moreover, is not merely in agricultural products, but in manufactured goods, which are going abroad to an unprecedented extent. Imports, at the same time, are shrinking and the trade balance in our favor is rolling up rapidly in consequence. As Europe has also begun to buy American securities gold must of necessity come over here in payment for foreign purchases. Over $6,000,000 of the precious metal is now in transit to our shores. Railway earnings show increasing improvement. The leading Northwestern lines report about 25 per cent. gain over a year ago, and the earnings of roads in all sections of the country are making an encouraging showing. In the iron and steel trade mills and furnaces are very active and the general tone is strong. Bessemer pig has reacted to a higher level during the week and prices of all finished iron and steel products are firm with an upward tendency. The metal market does not show much improvement, however, but has been dull, and weak in some lines, notably in lead, copper and tin plate. A sharp decline in the stock market has brought down values of standard issues from 3 to 4 per cent. this week. The market has again gone under "professional" sway. Money is still easy, but there is a considerably increased movement in commercial paper, banks buying very freely, while a large amount of good material is being offered. Collections are reported to be generally fair.

Business Failures.

A striking contrast between the conditions prevailing in the business world now and a year ago is suggested by the statistics of business failures for the quarter ended September 30 last. These show a very remarkable decrease to have occurred during the past three months, not only in the number of failures, but in the amount of the liabilities involved. According to the careful statements prepared by *Dun's Review*, the total liabilities of 2881 commercial failures in the United States during that period were $25,600,000, compared with 3757 failures, having over $73,200,000 of liabilities, in the third quarter of 1896. A more convincing demonstration of the improvement which has taken place in business conditions of late could hardly be furnished. Moreover, the returns show that the decline in failures was general throughout the whole country. In the New England States it was 45 per cent.; Middle States, 60 per cent.; Southern States, 55 per cent.; Central States, 80 per cent.; Western States, 60 per cent., and Pacific States, 10 per cent. The aggregate number of failures in the past three months was the smallest for any quarter since the third of 1892, and the lowest in any previous three months for 15 years, excepting six quarters, including one in each of the years 1885 to 1889. The average of liabilities for each failure, $8886, was the smallest in any quarter for the past 23 years, the nearest approach being $8922 in the first quarter of 1880. Taken in conjunction with the fact that the total of business payments through the banks of the country in September was the largest by $268,000,000 ever recorded for that month, these figures are eloquent of restored confidence and of a condition of business stability which is most gratifying.

Freedom from Labor Troubles.

Labor troubles in manufacturing establishments are not so serious as had been expected when business began to improve. The great body of workingmen undoubtedly prefer to be steadily employed, even if not entirely satisfied with wages schedules, rather than take chances of being out of work for an indefinite period. Small strikes are, of course, taking place here and there, but no great interests are involved, and they are usually precipitated by unskilled workmen whose wages are the lowest in the scale. It is certainly most gratifying that the resumption of activity has not been checked by disputes over the wages to be paid. If sliding scales could be made applicable to all employed in manufacturing establishments, a great deal would be accomplished in the avoidance of friction over wages. Participation in higher prices would then be a matter of certainty as soon as affairs changed for the better, and peace would at least be assured as long as markets were advancing.

THE LETTER BOX.

Power Required for Pumping.

From A. C. R., Marshall, Texas.—Please publish in *The Metal Worker* an answer to the following question: A stand pipe is located on a hill 2 miles from the pumping house and 115 feet above it. Water is pumped to the stand pipe through an 8-inch pipe at the rate of 350 gallons per minute. How much will the gauge in the feed pipe in the pumping room register—that is, how much pressure is required to force water through an 8-inch pipe 2 miles long at the rate of 350 gallons per minute? Will you also kindly publish the formula for figuring the above and for figuring the flow of water when the head, length and diameter are given?

Answer.—We find the friction, if the pipe line is straight or nearly straight, to be 13.48 pounds per square inch, and for the 115 feet head the static pressure is 50.05 pounds per square inch, making a total pressure of 63.53 pounds. This is subject to a variation of 0.43 pound for every foot of rise of water in the stand pipe above the 115 feet as stated. The friction of water flowing through pipes is obtained from the velocity and the diameter of the pipe. In our correspondent's case the 350 gallons must be reduced to cubic feet by dividing by the number of gallons per cubic foot, say $\frac{350}{7\frac{1}{2}} = 46.6$ cubic feet. The area of the pipe, 8 inches, is 50.26 square inches, and by the rule $\frac{46.6 \times 144}{50.26} = 133.51$ feet per minute and $\frac{133.51}{60} = 2.22$ feet per second, which is the velocity required in the formula.

Then by the formula of Weisbach $\left(0.0144 + \frac{0.01746}{\sqrt{v}}\right) \times \frac{l}{d} \times \frac{v^2}{5.4}$ = hight or head in feet required to overcome friction of flow. The figured formula then becomes $\left(0.0144 + \frac{0.01746}{1.49-}\right) \times \frac{10,560}{8} \times \frac{4.928}{5.4} = 31.35$ feet $\times 0.43 =$ 13.48 pounds per square inch friction.

The formula for the discharge in cubic feet per second is $\sqrt{\frac{d^5 \times h}{l}} \times 4.71$ = volume in cubic feet per second; d^5 is the fifth power of the internal diameter of the pipe in inches, h = hight of head in feet and l = length in feet, so that with an open end in the force pipe at the pumping station the figures will be $\sqrt{\frac{32,768 \times 115}{10,560}} \times 4.71$ = 90 cubic feet per minute, or 675 gallons per minute would be the free flow from the stand pipe through the pumping line.

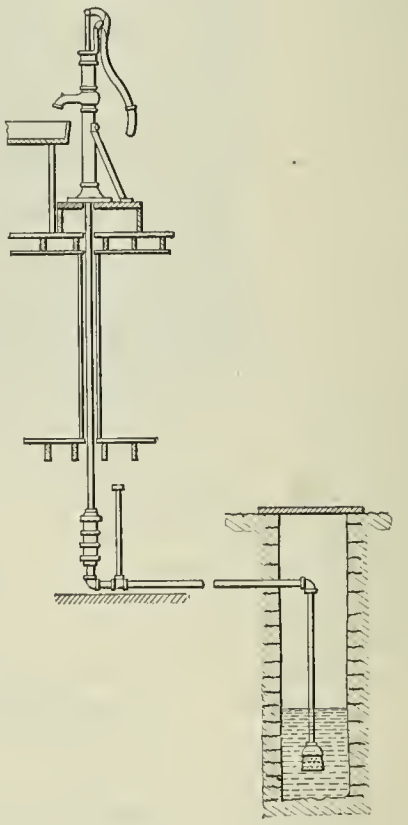
Material for Chimney Cap.

From C. S. G., Clear Spring, Md.—I would be glad to learn what is the best material to use to cover the top of a house chimney, as the gas from hard coal eats it up very rapidly. Would zinc be better than galvanized iron?

Note.—The acids formed by the condensation of coal smoke are often very destructive, and in some cases galvanized iron gives very unsatisfactory results. Zinc, under the circumstances, would be somewhat better, as there would be no coating to eat off and the material would endure until the entire body of the zinc was destroyed. In the case of galvanized iron, even supposing the coating to be uninjured in making the chimney top, there is so thin a surface that it would quickly corrode through to the iron itself, and that of course would not offer very much resistance to the acids. We would like to ask our correspondent if it has ever occurred to him to make a chimney cap of heavily coated terne plate, using one of the hand dipped plates carrying a thick coating of lead and tin, or using leaded plates? A heavy gauge metal coated in this way ought to give better results in such a place than metal coated with zinc, as lead is not influenced by sulphurous and sulphuric acids, which are sometimes carried in coal smoke, in the way that zinc and iron are. Of course, the best cap would be of terra cotta, but our correspondent evidently wants to use sheet metal.

What Pump Should Be Used?

From C. F. B., Guilford, Conn.—I wish to inquire through *The Metal Worker* what would be the best kind of pump for raising water from a well to a kitchen sink in the second story? The upright distance is 29 feet 6 inches and the horizonal distance is 45 feet. It must be made to operate easily and noiselessly. A 1¼-inch iron pipe is to



What Pump Should be Used?

be used. What style of pump is best to employ and how should it be set?

Answer.—In a pumping plan for a second story the pump body and handle may be set on a pedestal at a convenient hight for discharge into the sink. The bucket and valve chamber should be located in the cellar directly under and connected to the pump body with a 1½-inch pipe.

The bucket and handle shank should be connected with a half inch pipe to prevent the pump rod from vibrating and touching the outside pipe to make a noise. The pipe leading from the well should have a slope downward toward the well of 3 or 4 inches in the 45 feet, to allow the air to gravitate toward the pump. It should be laid below frost line or not less than 4 feet in your climate. The suction pipe entering the cellar at this depth will give ample room for the cylinder containing the bucket and suction valve to be connected to the vertical pump pipe and rod.

A tee piece with a short vertical pipe should be placed in the suction line near the pump cylinder for charging the suction pipe with water to start with and for recharging should the water run out by leakage of valves. This pipe also makes a suction air chamber and must be capped air tight after charging.

There should be attached to the end of the suction pipe a good leather seat foot valve and strainer, to be placed deep enough to be submerged when the water runs low. The well pipe should also be protected against frost, and all pipes should be of galvanized iron—pump chamber and buckets preferably of brass. We have designed the plan of a pump for a house with a cellar, but if there is no cellar beneath the place where the pump is to be located, the suction may be turned up to the first story floor and the arrangement made on that floor that is represented in the cellar. We cannot advise putting the pump bucket chamber on the second floor. It is too high a lift for the best operation of the pump, and would cause much trouble in keeping the charge. For a better finish in the first story or for protecting the pipe from frost, it may be belted and boxed, which will also make it noiseless from any jarring of the pipe when pumping.

Acids for Dissolving Iron.

From Walter B. Burrow, Norfolk, Va.—I notice in *The Metal Worker* of September 11 an inquiry from "Subscriber," Reading, Pa., asking for an acid to dissolve iron. I had occasion to reduce some iron wire to a diameter of 15-100 inch, and used the following mixture to accomplish it: Gallic acid (crystals), 10 grains; nitric acid c.p., 1 ounce. Prepare by shaking into a uniform mixture. Paint or rub the mixture on the iron or steel evenly; allow it to partly dry. Wipe the metal and apply until the desired thinness is obtained. The gallic acid may be increased a little if desired. It would be well to wear gloves during the operation, as gallic acid and nitric acid make an almost indelible stain on the skin. The above worked very well with me.

Paint for Galvanized Iron.

From J. H. C., N. Y.—Noting the inquiry of "Tinner" in *The Metal Worker* of September 25, I am somewhat undecided as to whether the character of the material on which the galvanizing is put is not responsible for the action of the paint. A great deal if not all of what is supposed to be galvanized iron, as sold to-day, is galvanized steel, and I know from using it in smoke pipe for furnaces that the galvanizing does not adhere to the steel with anything like the tenacity with which the galvanizing adhered to good refined and best bloom iron of two decades ago. This, however, is another question, for heat is an important factor in these conditions. For outdoor work the galvanizing may adhere to the steel with sufficient tenacity and this factor may be unimportant. I have made ventilators for churches and other buildings, of both zinc and galvanized iron, and in some instances these have been of an ornamental character and naturally had to be painted, and I have never had any trouble with paint peeling either from the zinc or galvanized iron ventilators when good materials were used. It has always been my custom to use the best materials I could find, and have found that boiled linseed oil is the best for outside work. Also that white lead of the best quality should be selected. It may not be generally known that there is a wide difference in white leads. What is known as the old Dutch process is the best if it is not adulterated but remains free from impurities. The test for impurities is to place a quantity of lead on a piece of lighted charcoal, and then with a blow pipe reduce the white lead to a molten state. If the lead all melts and runs off it may be looked upon as pure, while if it is impure a cinder will be left. Any coloring matter that may be used should be ground fine, and not used unless it is ground fine. If the painting is done with these materials and care is taken in the selection of materials, I think there will be little trouble with the paint standing.

From H. R. S., St. Louis.—I notice in *The Metal Worker* of October 2 a number of letters relating to the best paint for galvanized iron, and would like to call your attention to the Donkey paint made by the Kansas City Roofing & Corrugating Company, as a covering proof against moisture, acids, alkalies, ammonia and fumes from coal smoke. In using it it is desirable that the surface to be covered be completely free from grease, and all rust spots ought to be cleaned off thoroughly with a steel brush.

From W. H. M., Salem, Ohio.—I note the recent correspondence in *The Metal Worker* regarding the best paint for galvanized iron. We have found the best paint for painting any metallic surface is one composed of the best quality of red lead and linseed oil. This is what is specified by the United States Government and several of the foreign Governments, and we have always found it very satisfactory.

Trade School for Cornice Work.

From S. F. E., Sedalia, Mo.—Will you please tell me in the Letter Box if there are any trade schools in the West where I can learn cornice and sheet metal work?

Note.—We do not know of any schools in the West where these trades are taught, but we should be very glad to hear from any of our readers who can give us information on this point. The New York Trade School, 1260 First avenue, New York City, has a course such as our correspondent is looking for, and sheet metal work is also taught by the International Correspondence Schools, Box 968, Scranton, Pa.

Finger Marks on Planished Iron.

From Spokane, Wash.—"H. B.," Colfax, Ill., asked in *The Metal Worker* of September 25 how to remove stains and finger marks from planished iron. The prevention is all right, but every one is liable to a mishap occasionally. If "H. B." will use cut acid to rub on the marks and then dry by rubbing on commercial window whiting, I think he will look twice to locate the spots when through.

Brass and Copper Manufacturers at Rome, N. Y.

The Rome Brass & Copper Company, Rome, N. Y., are fitting up the addition to the copper mill built last summer with machinery, and in a short time expect to have it in operation.

The business of the brass and copper mills has almost doubled in six years. In 1891 the number of employees was 256; now it is almost 500. Repeated additions have been made to the plant in that time, until now both sides of Bouck street, from Dominick to the Central Railroad, are solidly lined with buildings. A large addition to the brass mill was built the past summer, and the steel framed addition to the copper mill, which was built last year, is one of the model factory buildings of the country.

The manager, J. S. Haselton, is investigating natural gas, and two wells have already been sunk under his direction, while a third has just been commenced at his residence.

Six years ago the Rome Mfg. Company's factory and R. M. Wilson's bathtub works, both of which are heavy customers of the Rome Brass & Copper Company, were not in existence. Now the bathtub works have an immense plant of their own, with a new department for making enameled bathtubs, and employ 125 hands. The Rome Mfg. Company have a model plant and the very best machinery, and can compete with any factory in the country. This concern use gas from the first well put down in Rome for brazing and lighting, without visibly affecting the supply. Mr. Wilson will have a well on the premises of the bathtub works before another season is over.

The announcement is made that acetylene gas is at last to be furnished on a commercial basis to the citizens of Chicago. A corporation has been formed, with a capital stock of $1,000,000, under the name of the Acetylene Gas Light & Fuel Company, which is backed by capitalists interested in the leading gas company of Chicago, and it is stated that pipes are to be leased from that company which are not at present in use but had been secured when rival gas companies were bought out.

THE COMPETITION AGAINST ANTHRACITE COAL.*

The optimist as to the future for anthracite coal has adopted a creed which begins : "There is only one coal, and anthracite is its name." There is as much self satisfaction derived from its utterance as the Moslem receives from a somewhat similar expression of his views as to religion. The anthracite "faithful" cannot see any future danger in the rapid growth in the use of gas for domestic purposes, in the possibility of an increase in the consumption of coke for domestic and manufacturing use, in the increasing displacement of anthracite by the lower priced bituminous coal, in the growth of steam heating plants, or in the more distant but none the less possible use of electricity for heating as well as for lighting and power.

It is argued that much of the gas that is replacing the domestic sizes of anthracite is made from hard coal and that, therefore, the decreased tonnage from this cause cannot be great. While it is true that anthracite is largely used for this purpose, it is also true that from each ton of such coal there are produced over 30,000 cubic feet of gas, and when this is used for domestic purposes each 5000 cubic feet replaces about 1 ton of anthracite. Further, the only reason why anthracite is thus employed is because it is cheaper than coke, and if at any time, through the more general use of by-product ovens, which produce a far cheaper coke than the beehive form, this fuel is reduced in cost to or below the price of anthracite, either it will replace the latter for gas making, or hard coal must be sold for a lower price. Still further, it is a matter of fact that in various cities, especially in New York, nearly all of the modern apartment houses are constructed without any provision for a coal stove. Steam heat warms the rooms, and the kitchens have gas ranges. It is being found more difficult each year to rent the old style apartments unless these improvements, gas and steam, are introduced. Gas is being largely employed for power in the cities, and no better illustration of the manner in which it is superseding hard coal can be mentioned than the fact that at some wharves in New York, where anthracite is unloaded from barges, the power is furnished by gas engines. As showing the result of the greater consumption of gas for cooking, compare the present value of the securities of the gas companies with their value ten years ago. Such a comparison shows that notwithstanding the decrease in the selling price of gas and the competition with electricity, there has been such a great increase in its consumption as to maintain, and in many cases largely increase, the value of the producers' securities. The same cannot be said of the anthracite interests.

THE USE OF COKE.

As to the possibility of an increase in the use of coke for domestic purposes, it is objected that this fuel costs more than anthracite at a distance of 100 miles from the ovens; that it is hard to burn, requiring special stoves, and that because of its friability there is a heavy loss in dust, both in transporting and handling. As a matter of fact the latter objection and the difficulty of first igniting hard coke are the only material reasons why it is not more largely used. In the Northwest, and at other points where there is a wide difference between the price of anthracite and coke, the latter, screened through 1½-inch and over ¼ or ½ inch mesh, is burned in ordinary stoves whenever a smokeless fire is wished, and gives thoroughly satisfactory results. Moreover, if, as is quite probable, future developments in the saving of the volatile products from bituminous coal lead to the manufacture of semi-coke, as is being done in England, this fuel will become a strong competitor, since, while friable and breaking easily to fine stuff and dust, it ignites readily and gives a clear, strong and smokeless fire. In its manufacture it has been found that the value of the products recovered by condensation is sufficient to repay the entire cost of the process and in great part the cost of bituminous coal used, so that the resultant coke, which becomes in reality a by-product, has almost nothing but profit charged against its cost, and consequently can be sold at an extremely low price. The by-product coke plant to be erected near Boston will likely produce coke of this character, using Nova Scotia coal, and it is quite possible that similar plants may be erected near other cities.

As to the inroads which it is known have been made into the anthracite market by soft coal, the optimists say that this year has been one of the lowest prices on record for bituminous coal, and since both railroads and operators are losing, such conditions cannot be expected to continue. And they claim further that it is only the smallest and least profitable sizes of anthracite which have been affected, and these in only a few markets. Proof is lacking, they say, to show that the hard coal market has been really affected, since throughout this year, even at the low price for soft coal, there has not at any time been an excess of the small anthracite steam sizes. This argument is good as far as it goes, but, like all half truths, that which it leaves unsaid changes the direction of the conclusion. It is true that this year has witnessed the lowest recorded prices for bituminous coal, but it is equally true that many of the contracts have been made to extend over a period of years. For years past there has been a steady decline in the price of this fuel, fluctuating, of course, from year to year, but with a general downward tendency. No person can say when this will stop and the price become stable. It was predicted only a few years ago, when the price of soft coal had declined until it sold for $3 per ton at tidewater, that no lower price would ever be taken. And this spring has witnessed $1.75 per ton at the same point. There is no guarantee that it will not go lower. It should not, certainly, but to say that it will not, or that it will increase and always hold a higher price, is a statement based on mere conjecture.

BITUMINOUS COAL.

It is the market for anthracite small sizes which has been mainly affected by the low prices of bituminous coal, though in the Northwest the domestic trade has suffered a heavy loss. The proofs that there has been a change from anthracite to soft coal by many steam users are numerous and easy to find. Every sales agent and commission house which handles anthracite can name not one, but many former customers who are now using soft coal, and who state that they are so pleased with the result that they will not again change. Another proof of the injury from soft coal is that the prices for the anthracite steam sizes have been declining, and even during the early months of this year, when they were scarce, the price received at tidewater was lower than in the latter part of 1896, when there was so great an excess that it had to be stocked at the mines.

Further, no account is taken of the improvements which are being made in stoves and ranges by which bituminous coal can be burned as a domestic fuel, without smoke. Exclusive of the East, there is a wide field in the South and West for such stoves, since there soft coal is used almost exclusively, and consequently inventors have a wide field open and are pushing into it. In the East, where anthracite is the generally accepted fuel, such stoves might not be looked upon with immediate favor, but it would not be long before a comparison between $5 anthracite and bituminous coal at half that price would induce the economical householder to arrange his furnaces for the cheaper coal. There are such stoves now made and they have been fairly successful, and the good results obtained have urged inventive genius to change and improve in the hope of a perfect success.

Steam heating plants have unquestionably caused a material decrease in the market for domestic coal. Those which, from choice or compulsion, use anthracite take the smallest sizes and in many cases use with it an admixture of bituminous coal. In large public buildings and residences the old style of grates and stoves burning egg and stove coal were replaced by large furnaces burning egg and broken coal in the basement, from which hot air pipes led to the various offices

* From the monthly letter of the Anthracite Coal Operators' Association.

or rooms. Then steam heating plants replaced the single furnace, and to fire them a cheaper anthracite, chestnut or pea coal, was used. Now the central steam heating plants, equipped with all labor saving appliances, are gradually taking the place of the local ones, and these large plants use the cheapest anthracite—buckwheat, rice and smaller—and their example has spread to the buildings which maintain their own steam plant. With such change there has been a reduction in the quantity of coal used and in the size. To heat an office building by steam, using stove coal, would require a smaller quantity than if stoves were in each room or a hot air furnace in the basement. There has been this decrease in consumption, and coupled with it the more serious change from the larger and profitable sizes to the smallest, and a further reduction in the quantity of these when bituminous coal is added to the fine anthracite. These central steam heating plants have been established in large and small cities and towns of fair size, and their patronage is growing steadily. Where the city ordinances do not prohibit smoke, it is to be expected that they will use soft coal when it can be purchased for less than anthracite, and with improvements in furnaces and grates tending to prevent smoke cheap bituminous coal may be used in all places.

ELECTRICITY.

As to possible competition from electricity as a heating agent, this is still for the future to develop. As yet it is too expensive and uncertain, but when there is considered the enormous advance which has been made in the past ten years in its application to various purposes, it cannot but be felt that the future, and maybe not far distant, may bring about inventions which will have overcome the present obstacles and place this convenient agent on a basis where it can compete, on most favorable terms for itself, for the household position now claimed for anthracite.

Indeed, viewing the anthracite situation from a broad standpoint, it must be admitted that the conditions of to-day are as radically different from those ten years ago as at that time conditions differed from 1877. The change in the industrial situation has been gradually crystallizing into the one idea of centralization. This in manufactories means large establishments with a central steam plant. Such an establishment can afford to construct this plant so as to contain all of the latest and best improvements tending to increase its efficiency, and can experiment in this direction where smaller manufactories cannot, because of the cost. The prime object of any modern steam plant or manufacturing establishment of any kind is, quality being satisfactory, to produce the largest possible quantity at the lowest possible cost. Consequently, in the matter of fuel, the cost per unit of work done is the basis of comparison. Since it is a practical and admitted fact that anthracite prepared sizes, chestnut and larger, do not possess any intrinsic heating merit over a good quality of soft coal save in being smokeless, and since the latter coal sells for less than half the price for anthracite, then these sizes of anthracite are virtually out of any competition with bituminous coal. The small sizes of anthracite, however, sell at nearer the price of soft coal and are about equal to it in heat value, and these two are active competitors, and soft coal has a growing opportunity through its lower cost and the improvements by which it may be burned without smoke.

Considering the facts that have been given, and also the statistical position of the anthracite trade, it is evident that the entire tendency of to-day, while not yet toward a decreased consumption of anthracite per capita, is toward a marked increase in the consumption of the small sizes in preference to the prepared sizes, and in this connection there is good reason to believe that there has been an actual decrease in the per capita consumption of the latter sizes. Where will be the end? It is impossible to produce these small sizes and sell them at their present prices with profit, and if the price is increased above that of soft coal the latter will largely replace the anthracite.

It is not intended to go to the other extreme and become unreasonably pessimistic as to the future for anthracite. There is the certainty that this coal will be used by many for long years to come, but it is poor policy to disregard self evident dangers and stand idly waiting for the time when they will assume such proportions as to require a drastic remedy, with the chance that it may be applied too late.

Where Aluminum is Unsuitable.

Aluminum has been suggested for many purposes for which it is not adapted, said President Alfred E. Hunt of the Pittsburgh Reduction Company, in the course of a recent lecture before the Franklin Institute of Philadelphia. Prominent among these may be mentioned cases where much soldering or brazing of the metal has to be done. Because of the difficulties in soldering and brazing the use of aluminum has, in most such cases, failed.

Another source of failure of the metal has been in attempts to apply it where gas or liquids are confined under heavy pressure in aluminum apparatus. Aluminum has so far proved so open and porous in its texture as to be incapable of withstanding, in the form of castings, more than 100 pounds per square inch without leaking. Undoubtedly, in the future, better work will be accomplished and aluminum castings will be made which will withstand higher pressures without suffering liquids or gases to percolate through the pores of the metal; but, so far as the writer is aware, this has not been found to be the case in commercial work of pure aluminum and alloy castings of the present day.

Another source of failure of aluminum in the arts has been the attempt to use it under high temperatures. The melting point of aluminum, according to the latest experiments, is 1200 degrees F. The "critical point," if I may be allowed to use this term in this connection—that is, the place where the metal begins markedly to lose tensile strength—is lower comparatively for aluminum than for metals of higher melting points. While it is true that copper, steel and similar metals all markedly lose in strength when heated to over 500 degrees F., with aluminum the temperature at which the metal begins to lose materially in tensile strength is between 300 and 400 degrees; and the writer would not recommend the use of aluminum where the temperature is in excess of 300 degrees F. This will preclude the attempts which have been made to use aluminum for steam boilers and steam apparatus of similar character where the pressure is high. It has been found that a small percentage of iron materially raises the melting point.

Iron Meteorites.

The enormous iron meteorite—so called—which was recently brought to New York by Lieutenant Peary from Greenland has excited a good deal of public interest in these comparatively rare objects. Its weight is said to be nearly 100 tons, or exceeding that of any specimen of a meteorite hitherto located. A few of the largest iron meteorites that are known are mentioned by a writer in the New York *Tribune* as follows: One which was found near Cranbourne, Australia, weighs 8224 pounds, or about 4 tons. An irregular mass found in the interior of Brazil, near the Bendego River, more than a century ago, and recently removed to the National Museum in Rio Janeiro, has been estimated at 7 tons or more. South America also has another huge specimen. At Tucuman, in the Argentine, there is a 15-ton block. The Gregorio meteorite, found in Mexico, weighs about 18 tons, and is the largest single block whose genuineness is undisputed. The Chupaderos specimens, now belonging to the School of Mines in Mexico, weigh 10 and 12 tons respectively, but are parts of what was once a single mass. The two finest collections of meteorites are those in the British Museum and in Vienna.

N. E. Whitaker, president of the Whitaker Iron Company, Wheeling, W. Va., has accepted the West Virginia vice-presidency of the National Association of Manufacturers of the United States.

A large shipment, consisting of 24 cars, of enameled steel tanks was made last week by the Pfaudler Vacuum Fermentation Company, Detroit, Mich., to Boston. The tanks are said to be the largest specimens of enameled steel ware ever made.

The main offices of the Pittsburgh Reduction Company, manufacturers of pure aluminum, have been removed from Pittsburgh to New Kensington, Pa., where the works of the concern are located. In the future all mail should be addressed to the company at Pittsburgh, as heretofore, while all telegrams and other communications requiring immediate attention should be sent to the company at New Kensington, Pa.

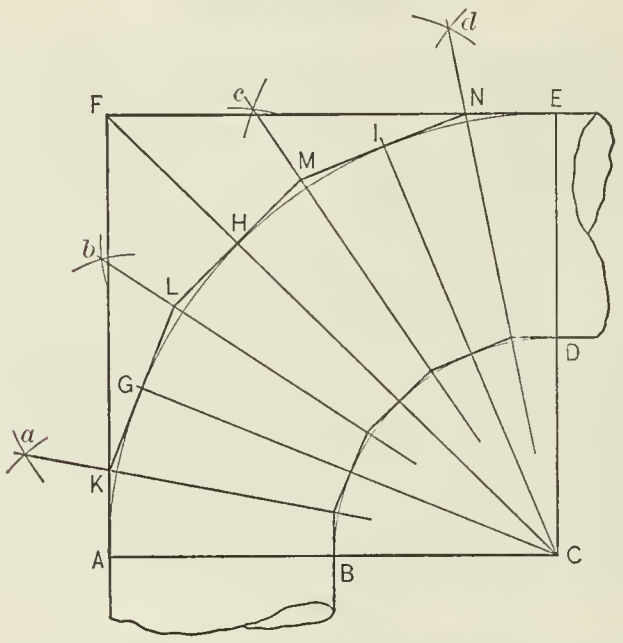
SHEET METAL WORK.

ELBOWS OF MANY PIECES AT ANY ANGLE.

A correspondent, "J. P. J.," Manitoba, asks us to present in the columns of *The Metal Worker* a method of obtaining the pattern for an elbow in any number of pieces at any angle.

What our correspondent probably wishes to know is how to draw the elevation of any elbow embraced within the scope of the above inquiry rather than the method of developing the pattern. With a correct elevation or draft of the required elbow, showing the exact number and angle of the miter lines, any one familiar with elbows in general would have no trouble in cutting the patterns.

Let it be required to draw the elevation of a right angle elbow in five pieces. Upon any horizontal line, as A C in Fig. 1, set off the required diameter of the elbow A B. Upon A B extended assume any point, as C, which may be placed nearer to or further from B according to the space allowed for the curve of the elbow. From C as a center, with C A as radius, describe the arc A E, terminating it with a vertical line from C. Now divide the arc A E into a number of spaces equal to one less than the required number of pieces in the elbow. As a five-piece elbow is required, divide A E into four equal spaces, as shown by the points G, H and I, and from each of the points of division draw lines to C, as shown. Then C A, C G, C H, C I and C E will be the five center lines of the five pieces as required. The miter lines may then be found by bisecting the angles A C G, G C H, &c., either as shown by the intersections of the arcs at *a*, *b*, *c* and *d*, or by drawing the lines through the points G, H, I and



Elbows of Many Pieces at Any Angle —Fig. 1.—Right Angle Elbow in Five Pieces.

E, respectively at right angles to G C, H C, I C and E C, intersecting at the points K, L, M and N, from which points the miter lines are drawn to the point C. The inner line of the elbow or throat may be completed by drawing the side of each piece parallel to the outer sides and tangent to the arc B D, whose center is C.

In speaking of the five center lines referred to above, it will be noticed that the lines C A and C E, though not center lines in the true sense of the word, occupy the same relative positions to the adjacent miter line as do the center lines of the three intermediate pieces. A five-piece elbow therefore consists of three symmetrical pieces and two half pieces, extended according to convenience, to form part of the lines of pipe. Since between any five radial lines only four spaces can exist, and since the center lines of the several pieces of the elbow are obtained first, the reason for dividing the arc of the elbow into one less space than the number of pieces required is obvious.

Should it be required to construct the elevation of an elbow at other than a right angle and of the same number

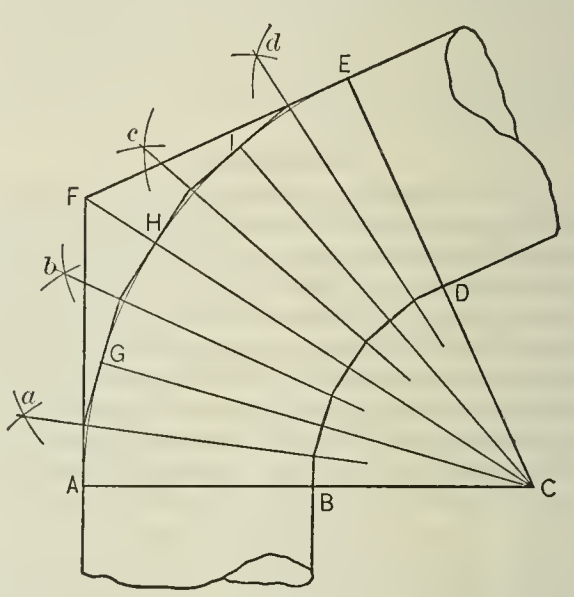


Fig. 2.—Five-Piece Elbow of Other than Right Angle.

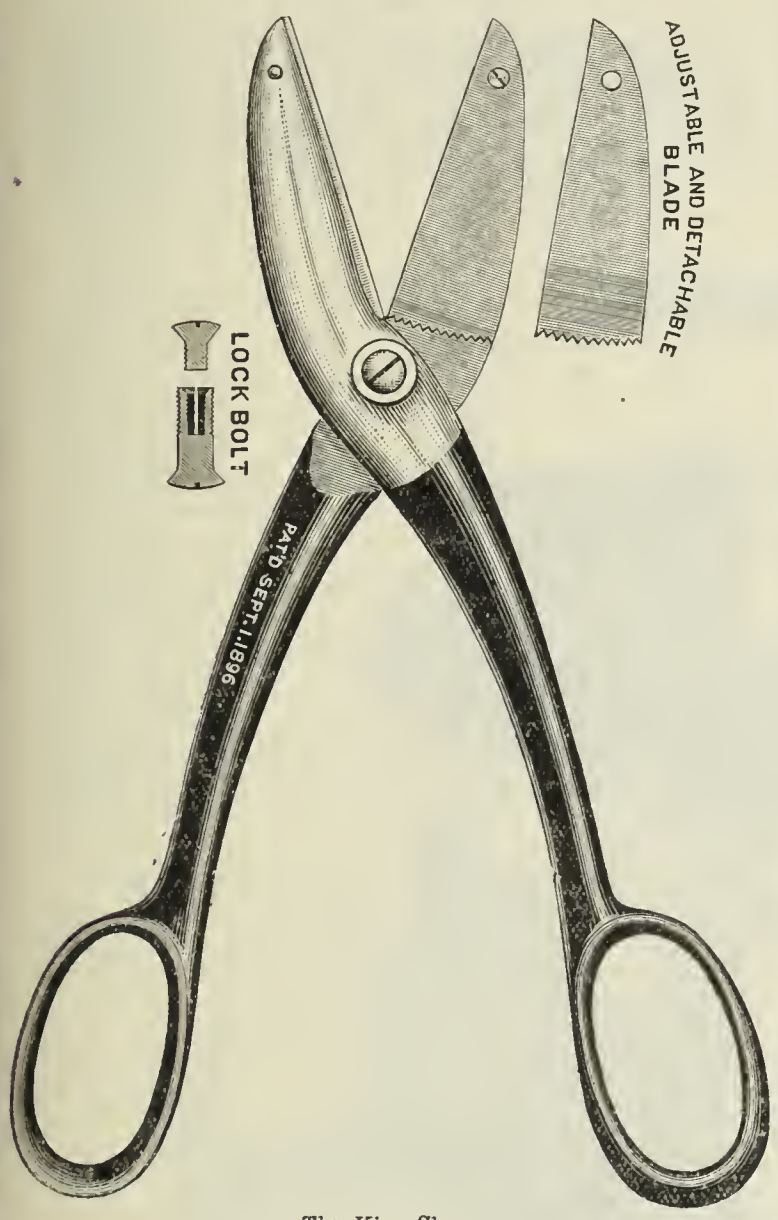
of pieces as before, the work can be accomplished by exactly the same method as given above for the right angle elbow. In Fig. 2 let A F E be the required angle. First bisect the angle A F E by the line F C, and upon F C establish the point C at convenience, as before. From C draw C A and C E, respectively at right angles to A F and F E, and from C as a center, with a radius C A or C E, draw the arc A E. Divide the arc A E and conduct the subsequent operations all as described above for the right angle elbow. The reference letters in Figs. 1 and 2 are made to correspond, so that the demonstration applies equally well to either figure.

Export Business in Galvanized Iron.

According to a prominent export firm interested in the Mexican trade, the galvanized sheet iron manufacturers of the United States are losing considerable business in Mexico on account of not being able to compete with the British makers. "Recently," said a member of this firm to a representative of the New York *Journal of Commerce*, "we had occasion to purchase several tons of this material. After obtaining prices from all the Eastern and Western manufacturers that we knew of, we cabled for prices to London. The British quotations were about 10 per cent. lower than the lowest American price. It is only in emergency cases that galvanized sheets can be purchased in this market for export. If the exporter can afford to wait money may be saved by sending for it to the other side, shipments to be made direct." A leading firm in the Argentine Republic trade claim, however, that recently they have found that the American sheet iron manufacturers have begun to realize that the South American market is quite important, from the number of orders they have lost, and it is believed every effort is being made by several of the most prominent manufacturers to increase their trade. The increased use of galvanized iron sheets for building purposes both in Mexico and Argentina has led to an important trade in this article. Great Britain, according to official figures, sold Mexico in the first eight months of this year 2893 tons, worth $158,490, as against 2598 tons, worth $148,395, in the same period last year.

The King Shears.

We illustrate herewith the King shears, manufactured by the Hagey Stove Company, St. Louis, Mo. A special feature of this tool, as the illustration shows, is the adjustable and detachable blades, which are made of tool steel, carefully tempered. These blades are fastened at the point by means of a lock bolt, the ends being counter sunk even with the face of the shears, so there are no nuts to come loose or interfere with the cutting. The inner end of the adjustable blade is serrated and is fastened in place as shown in the illustration. The manufacturers state that the shears will last a lifetime with an occasional set of new blades. They also point out an advantage on their shears, due to the fact that the blades are not subjected to the great heat of welding. The King shear blades can be taken off the shear and ground, it is claimed,



The King Shears.

in one-quarter the time required for a welded blade shear, and by the notches in the ends of blades they can be set to corresponding notches in the shears. The blades can be adjusted and ground until used up, when a new set of blades can be obtained at a small cost. These shears are made in six sizes with from 2 to 3½ inch cut.

FLASHINGS.

A circular printed in blue and red is distributed by the Double Truss Cornice Brake Company, Buffalo, N. Y., in the interests of their brake, with which many of our readers are familiar. The circular numbers a dozen pages and contains testimouial letters, all of which are dated September of this year, and come from the East and the West and the North and the South. The satisfaction which the writers express is excellent testimony to the qualities of the Double Truss Cornice Brake. On the last page is a list of a number of large buildings for the Cornice and Sheet Metal work of which these Brakes were used.

The roofing establishment of J. F. Young of Thirty fourth street, Pittsburgh, Pa., was visited by fire last week, and through the destruction of the building and machinery a loss of $7000 was sustained.

The Scottdale Iron & Steel Company, Scottdale, Pa., have dismantled their Bar and Muck mills and will install in their room a new train of three Sheet mills. Five new furnaces will also be added and other improvements will be made in the company's plant.

The four sheet mills of the Sharon Iron Company, Sharon, Pa., have been put in operation.

A fine specimen of what can be done in architectural sheet metal work is shown in the new front on the building of P. McGovern, the work having beeu done by F. W. Stelling, Hartford, Conn.

The Geo. Drouve Company, Bridgeport, Conn., are making the skylights for the new *Times* Building, at Hartford, Conn.

The Board of Trustees of the North Illinois Insane Asylum, Elgin, Ill., recently placed an order for about 100 squares of Smeeton's metal shingle, manufactured by Henry Smeeton, 109 Main street, Ottawa, Ill. Some eight years ago the trustees of the asylum made a test of various roofings and decided in favor of the Smeeton shingle, they now having some 500 squares of this roofing on the building. The shingle has double locks on each side of its four sides, a feature to which the manufacturer particularly alludes.

Proposed Machinery Museum in China.

Gervase Cooke of the Anglo-Chinese College, Foochow, China, writes with reference to the establishment of a museum for the display of European machinery. He says: It is because of the conditions of Chinese mechanical appliances that I have decided to open a museum of all kinds of machinery, in order that the Chinese may understand by comparison the clumsiness of their tools. Foochow has a population of over 1,000,000 and is the capital of Fukien province, one of the largest literary and political centers of the empire. The leading men of the province are alive to modern improvements, and plans are being made to introduce such machinery as will be helpful to the Chinese. By invitation I came to China to start flour, rice and cotton mills, and assist in introducing modern machinery and open up mines. In conversation with Li Ye Chen, Chinese ambassador at Calcutta, India, he expressed himself greatly pleased to learn that steps were being taken to introduce modern machinery into China. I have already been engaged by a Chinese syndicate as consulting, civil and mining engineer, to open up coal, silver, lead and iron mines and to erect furnaces for smelting the metals in the province. Mauy specimens of the minerals have been examined and found to be very valuable. The coal is anthracite and of a splendid quality. Already some tools and appliances have been ordered for the purpose of developing the mines. The museum referred to is to be conducted solely for the purpose of increasing the interest and knowledge of Western learning and attracting the attention of inquirers. Exhibits of the character above described will be received and advantageously employed for the benefit of exhibitors as circumstances will permit. Working models, photographs or drawings of machinery and inventions or specimens thereof may also be sent. Each exhibit which may be presented to the museum will be marked in Chinese, with the name and address of the maker, together with the description, price (if desired), and a capable translator will explain their use to inquirers.

The Chamber of Commerce of Cologne, Germany, recently sent a circular letter to a number of firms in the vicinity of that city who are engaged in trade with the United States, asking their views as to the adoption of retaliatory duties by Germany to meet the new American tariff law. The *Cologne Gazette* reports that a large majority of the export firms and of the importers declared themselves strongly against such a course.

On her Easteru passage between New York and Southampton, the "Kaiser Wilhelm der Grosse," the huge new North German Lloyd steamship, again broke the Atlantic record, makiug the passage in 5 days 15 hours 13 minutes, reducing her own maiden time, accomplished in the previous week, by 7 hours 22 minutes. The best eastward record on the same course was, until last week, held by the Hamburg-American liner, "Fuerst Bismarck"—namely, 6 days 10 hours 32 minutes. The new vessel has reduced this by 15 hours 19 minutes.

A dispatch from Houghtou, Mich., says that the St. Mary's Canal & Mineral Land Company bave sold a tract of 4000 acres of mineral land, locally known as the Six-Mile Hill Mine, to Cameron, Currie & Co. of Detroit, for $500,000. A company is being organized in New York to operate the mine, which is said to have au excellent quality of copper.

Francis I. Maule, the well-known advertising specialist, has returned from Europe. Mr. Maule's address is 328 Chestnut street, Philadelphia.

HEATING AND PLUMBING.

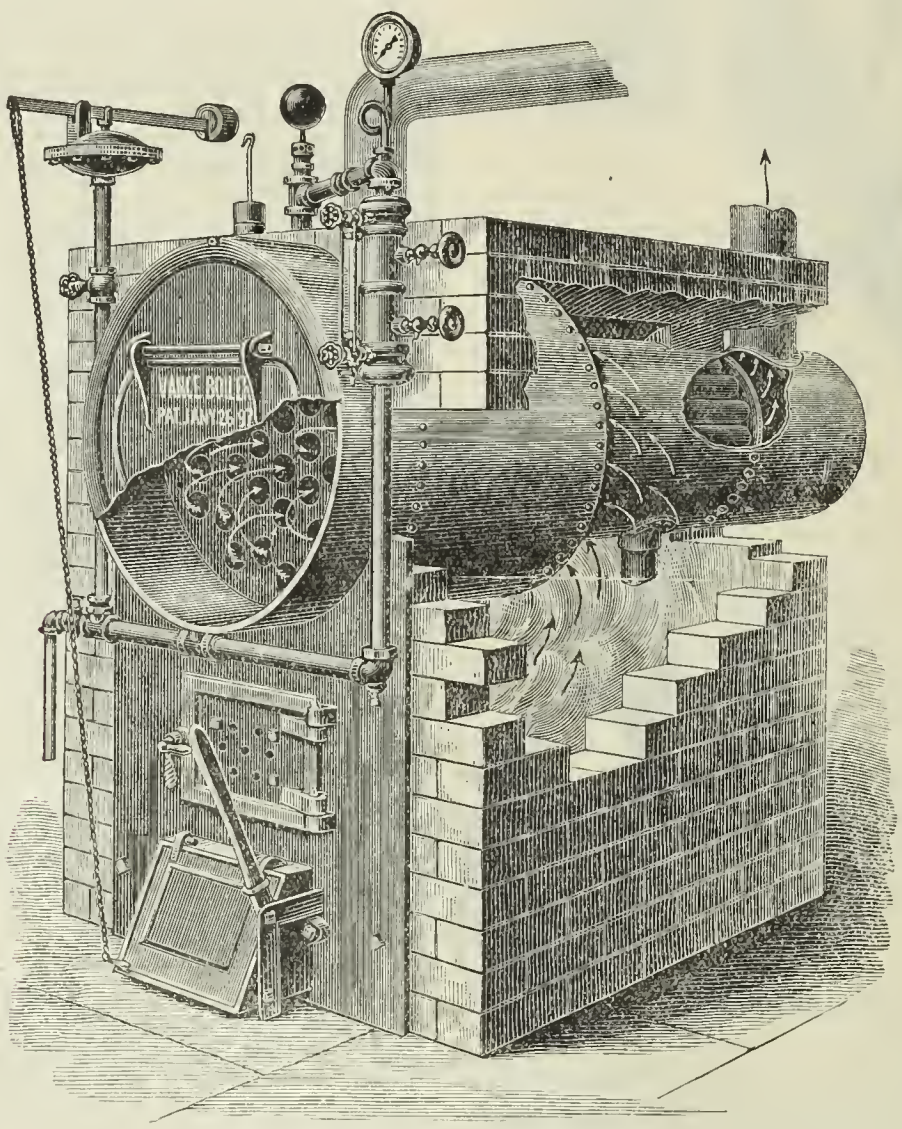
The Pennsylvania Steam Fitters' Convention.

William P. Thompson, National vice-president for Pennsylvania of the National Association of Master Steam and Hot Water Fitters, has issued from his office, 112 Bread street, Philadelphia, a call for a convention of the Pennsylvania Master Fitters, in accordance with the proposal to hold a convention last June, and which was delayed. The convention will be held at the Hanover Hotel, at Twelfth and Arch streets, Philadelphia, at 2 p.m., on Wednesday, October 27. National President E. D. Smith will preside at the convention, and will lend his assistance in the work before it. All who are engaged in the heating trade throughout the State, whether members of the association or not, are invited to be present to acquaint themselves with the objects of the association and to become members. It will be an open convention to gather the craft and legislate for the mutual benefit of the trade.

C. T. Stephens has formed a partnership with Fred. Masters to conduct a plumbing and steam fitting business at Ithaca, N. Y. The present plumbing inspector, Mr. Chappell, was formerly in the employ of Mr. Stephens, and the department left vacant by his withdrawal is supplied by the forming of the partnership. Mr. Masters has been engaged in the plumbing trade for the past 20 years and is considered one of the most expert plumbers in the city. The plumbing shop of the new firm is situated in the basement of Mr. Stephens' store, corner of State and Aurora streets. The new partnership applies only to the plumbing department, and does not include the hardware business, which will be continued by Mr. Stephens the same as in the past.

The Vance Boiler.

A house heating apparatus of somewhat different type from that generally used for the purpose is presented in the Vance boiler, shown herewith by means of a broken view. The boiler, which is made by the Vance Boiler Works, Geneva, N. Y., is arranged for brick setting and has a rectangular fire chamber fitted with a labor saving grate. The boiler proper is formed of two cylinders, supported horizontally over the fire, the larger one at the front presenting the larger exposure to the fire, and is connected with a smaller cylinder at the rear. The products of combustion on rising from the fire pass through the tubes in the lower portion of the boiler to the front and return through the tubes in the upper part of the boiler to the rear and finally to the outlet, the shell of the smaller cylinder at the rear being continually exposed both to the fire and the gases in active course of combustion, so that the boiler presents what is said to be a very efficient heating surface, and it is claimed that the arrangement is such as to secure a large saving in the fuel consumption. A plate is arranged at the front of the boiler, through which the tubes may be readily cleaned with a brush. The boilers are made in 13 different sizes, and equally well adapted for either steam or hot water heating. For steam heating they are rated to carry from 150 to 2500 square feet of surface, and from 350 to 3800 square feet of surface for hot water heating. The catalogue of the company gives grate and fire surface of the boiler, and the propor-



The Vance Boiler.

tion in the steam boilers is 1 square foot of grate surface to about 30 square feet of fire surface, and the proportion of fire surface to radiating surface increases as the boilers increase in size from 1 to 5 in the smaller sizes to 1 to 8 in the large sizes. In hot water heating the proportion of grate to fire surface is 1 to 25, and the proportion of fire to radiating surface is 1 to 10. A catalogue which gives full details and description, with prices and dimensions, can be secured on application.

The Journeymen Plumbers.

The National Association of Journeymen Plumbers, Steam Fitters and Steam Fitters' Helpers closed their annual convention at Nashville, Tenn., by electing the following officers :

President, John S. Kelly of Chicago.

Vice-Presidents, W. F. Hagerty of Nashville, J. L. Richardson of Cincinnati, L. H. Balfe, Denver, Col.; William Marsh, Washington, D C.; Joseph Burger, St. Louis ; L. H. Tilden, Cleveland ; C. F. Cromer of Salt Lake City.

Secretary and Treasurer, W. J. Spencer, Buffalo, N. Y.

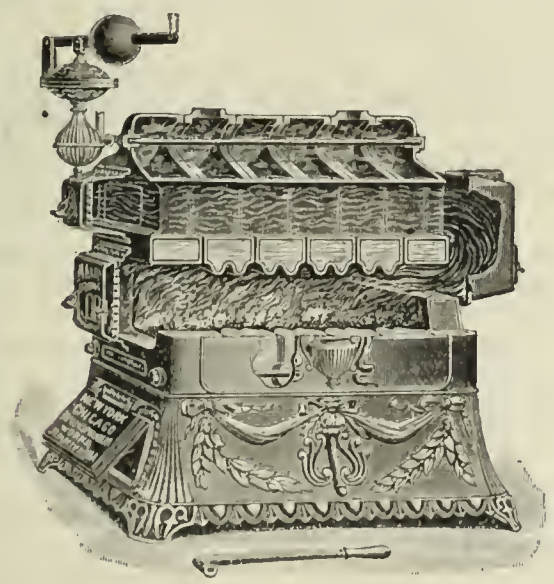
Assistant Secretary and Treasurer, J. D. Meeks, Pittsburgh, Pa.

The next convention will be held in Cleveland, Ohio, in September, 1898. M. J. Counihan, who has been secretary for a number of years, refused re-election, although the popular choice, as he did not care to take up his residence in Chicago, preferring to remain in his native city, Pittsburgh.

President Kelly and Secretary Spencer are arranging for several conferences provided for at the convention. One of these will be with the Master Plumbers' National Association, and is for the purpose of making a new apprenticeship law on the lines in force in Chicago—one apprentice to each shop. Another will be held with the officials of the Steam Fitters' International Union, and contemplates the uniting of the two organizations. At the last meeting in December every branch of the United Association will vote on a proposition to adopt the system of strike, sick and out of work benefits on the plan in force in the Cigarmakers' Union.

The Bundy La Villa Heaters.

The sectional view, Fig. 1, presented herewith, shows the construction of the Bundy La Villa heater, made by the A. A. Griffing Iron Company, 66-68 Centre street,



The Bundy La Villa Heaters.—Fig. 1.—Sectional View.

New York City, with works at Jersey City, N. J. The manufacturers refer to the fact that it is ornamented and thus designed for placing in a living room, which can be warmed by the heater the same as if a stove warmed it. This arrangement is necessary where there is no cellar under the house, and is the condition also met with in many small railway stations, which can be heated by placing the La Villa heater in one waiting room and radiators in the other room and in the ticket office. The heater is made in two styles, one ornamented and the other plainer, the latter costing less and being the one adopted where the heater is to be set in the cellar or in a vacant room. Where it is placed in an inhabited apartment it may be supplied with an ash pan, the same as a stove.

The products of combustion travel three times the length of the heater, and the fire box is corrugated at the top and sides to secure the greatest amount of fire surface. The heater is cleaned by opening the front and rear clean out doors, and the manufacturers particularly allude to the ease with which the cleaning can be done, and emphasize the necessity of keeping the surfaces clean if the heater is to give economical and efficient results. The La Villa is not designed for heating large buildings, its legitimate field for use ranging for steam in the smallest houses to those requiring 700 feet of radiation and for hot water up to 1050 square feet of radiation.

The heater is provided with a dumping and rocking grate of an improved herring bone pattern, a broken view of the base being shown in Fig. 2. The fingers interlock and the space between is uniform throughout, as is also the space between the grate and sides and ends of the fire pot. The bars rest on supports that are securely fastened to the sides of the ash pit. Special care, the manufacturers state, has been taken to secure a liberal area in the air supply through the grate, without having any openings large enough for unconsumed coals to drop

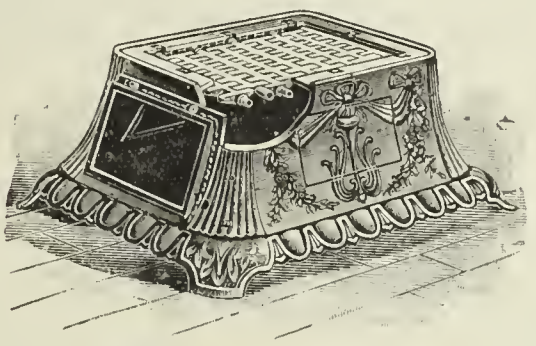


Fig. 2.—General View of Grate.

through. The grates are all in position when the heater is shipped, but they may be removed and replaced at any time through the opening in the side of the ash pit by removing the panel shown in Fig. 2.

Plumbing Class at Bridgeport.

The course of instruction in plumbing at the Trade School and Institute at Bridgeport, Conn., under the supervision of C. S. Eames, is as follows: The instruction will be both manual and scientific. The manual instruction will be as follows: 1, Lead seams; 2, overcast joints; 3, cup joints; 4, calking; 5, wiping horizontal round joint; 6, horizontal branch joint; 7, upright round joint; 8, quarter bend; 9 upright branch joint; 10, wiping on a stop cock; 11, wiping a flange on a 2-inch pipe; 12, wiping a 2-inch ferrule; 13, wiping in a bath plug; 14, wiping a vertical branch; 15, wiping a side flange; 16, traps. At the conclusion of this course, miscellaneous and fancy work—wiping tank seams, setting basins, boiler work, sand bends, &c.

The scientific instruction will be upon the proper arrangement of service and waste pipes and upon drainage and ventilation, as follows: 1, Drain, soil and waste pipes; 2, supply pipes; 3, boilers; 4, tanks; 5, fixtures; 6, trapping and ventilation of fixtures; 7, pump; 8, miscellaneous.

Water Main a Century Old.

A curious wooden water main and a brick sewer have been unearthed in Centre street, New York, by workmen employed in laying the new trolley system of the Metropolitan Street Railway Company. The sewer was made of brick, with walls 6 inches thick, and was 8 feet in diameter. When it was broken open several bricks bearing the imprint "Manhattan, 1797," were found. All the bricks were peculiar in shape, being only 1½ inches thick. It was near Canal street, in Centre, that 100 feet of the wooden water main was found. The main was made of logs, about a foot square, and made hollow by burning. Each section was about 5 feet long, with one end sharpened like a lead pencil so as to fit into the next length. Each joint was fastened with a riveted iron band. Both the sewer and the water main were laid by the Manhattan Company, who received their charter from the Legislature and were established in 1799.

The New York Central Iron Works, Geneva, N. Y., recently made a shipment of 20 of their Dunning steam heating boilers to Philadelphia, and a shipment of 20 more to a New England house. The works are now running overtime.

A Warm Discussion.

A little pamphlet in a lemon colored cover bearing a design in red and black is entitled "A Warm Discussion," and relates to the Gorton side feed boilers. These boilers are of wrought iron construction, with drop tubes, so that a large surface is presented, the tables in the book giving the amount of surface exposed in each boiler. The principal feature which is dwelt upon in the pamphlet is the provision for supplying the fuel, openings being made at the top of the fire pot at four different points. The opening slopes at the bottom so that the fuel is fed in by gravity, in much the same manner as fuel is supplied to the fire by a mechanical stoker. This arrangement, it is pointed out, serves an excellent purpose when soft coal is used. Another feature which adds to the advantage of the boiler for soft coal is the construction of the grate and a fingered ring placed above the grate and below the bottom of the fire chamber proper. With this fingered ring an abundance of air may enter the fire, and effect such thorough combustion that heavy smoke is prevented. It is claimed that by this construction of grate and fire chamber the smoke issuing from the chimney to which one of their heaters is attached is of the same general appearance as that issuing from the chimney where hard coal is used, so that not only is fuel saved in developing a given heating power but also the soot nuisance in the atmosphere removed. Accompanying the pamphlet is a sheet of testimonials from the soft coal regions of Ohio and Iowa, in which the owners claim that with the fine refuse or slag coal, which can be purchased at a small cost, the heaters operate satisfactorily.

The Trade in Brass Fittings.

As there is no other line of business which better illustrates the general progress in the iron manufactures than that of the manufacture of brass fittings, a short review of the business for the past year in this line will be of interest to readers of *The Iron Age*, says a Cincinnati correspondent of that journal. One of the largest and most prosperous brass working establishments in this section of the country is the Lunkenheimer Company, whose headquarters are in this city, with branches in New York and London. Secretary D. T. Williams of the company thus outlines the situation: Business was better in 1896 with this company than it was in the year preceding, and so far 1897 has been much in advance in volume of the business done in the same period in 1896. During all the hard times which are now believed to be drawing to a close this concern have gone on steadily expanding, taking in new quarters, putting more men to work and otherwise increasing facilities for turning out work. At this date they have just rented the building on Eighth street immediately east of their factory and are now moving their office and salesrooms into it, thus giving more room for the manufacturing part of their business in the old building. Secretary Williams attributes the unchecked success of this company to judicious advertising, backed of course by superior quality of goods turned out. All through these years, while other concerns were bewailing the hard times and cutting down the expenses, decreasing advertising, &c., the Lunkenheimer Company were more aggressive than ever in keeping themselves before the public notice, and the result has been as stated. Secretary Williams says that they understand perfectly well that their business on that account is not a good criterion of trade in general. The concern furnish steam fittings and engine builders' supplies. The demand in this line shows that there is considerable expansion in that branch of manufacture. The agricultural implement manufacturers have also been taking considerable of their product during the past six months. About 25 per cent. of the entire product of their factory during the year 1896 went to foreign countries. At the present time the outlook is much better. There is a brighter and stronger feeling in jobbing circles, and everything goes to show that stocks are being largely increased. Business is well distributed over all sections of this country. Prices have remained practically unchanged, and there appears to be no immediate prospect of an advance which would be commensurate with the increased cost of metal. When asked the pointed question as to whether prosperity was really upon us or whether the good time talk was simply a myth, Secretary Williams expressed himself in unqualified terms that not only was the outlook better but that actual business on all hands was being much increased.

Another large and exceedingly prosperous concern are the William Powell Company. Secretary Albert thus outlined the situation: The early quarter of the year 1897 was a rather quiet one; the second quarter trade showed some improvement; the last three months it has been very good, and at the present time the large shops are running on full time with a full complement of labor. The year so far, on the whole, shows but little improvement excepting the last quarter over last year, but from the present outlook it is believed that by January 1, 1898, they will have a nice surplus over the amount of business which was done last year. Prices are still rather low. Metals have advanced. Two years ago the concern bought copper at 9½ cents a pound; now they have to pay 11¼ cents, but as yet the general condition and the sharp competition prohibit advancing prices. The general outlook is excellent, and Secretary Albert expresses the positive opinion that an era of good times has dawned upon the public generally. The company's trade is pretty well distributed over the country, and there has been and is now no special movement in any branch sufficient to attract their attention. The company make no special effort to secure foreign trade, yet at the same time they find their sales in that direction gradually expanding, and it is a question if in the near future they will not have to pay more special attention to that trade than they ever have done in the past.

Alexander Riegler, an old time manufacturer of this city, who makes a specialty of water works and plumbing goods, whose trade-mark is well-known all over the United States, reports business at his shop to be about as follows: He has always enjoyed a very large local trade, and while this has been a little light for the past year or two, yet at the present time it is showing considerable increase, and the prospect of the erection of new water works in this city gives him reason to believe that his local trade will soon resume its former proportions. Within the last few months quite a good sized proportion of the product of his shops has gone to Southern cities, where he has had some pretty good municipal contracts. Thus far 1897, however, has been but little if any ahead of 1896 in volume of business, and prices are still exceedingly low, competition sharper than it ever was and metal advancing. At present all signs, however, point to an immediate expansion of trade.

NOTES.

J. B. Colt & Co., 115 Nassau street, New York City, who are the sole agents for the Automatic Acetylene Gas Generator, are exhibiting in the New Zealand Building, Thirty-seventh street and Broadway, New York City, a complete acetylene gas generating apparatus in operation, and other apparatus showing the uses to which the acetylene gas may be put for lighting magic lanterns and other purposes.

James J. Duggan, Baltimore, Md., bid $2900 and secured the contract for a flushing closet system for No. 30 Primary School and No. 8 Grammar School.

The Judson A. Goodrich Company have been incorporated in New York to manufacture Steam and Hot Water Heating Apparatus and Supplies, with a capital of $10,000. The directors are Judson A. Goodrich, R. Ward Hillman and Charles L. Krefel. The new company have their office at 228 Water street, New York, and are already known to the trade, having been engaged in business some time under the name of Judson A. Goodrich & Co.

The Enterprise Gas & Electric Fixture & Brass Company of St. Louis have been incorporated, with a capital of $20,000, by Fredelshon Harris, T. A. Morrey, Eulalia H. Morrey and Harry Phillips.

The Commissioner of the Building Department of Boston, John Damrell, has appointed the following men as inspectors of gas fitting, in accordance with the law which went into effect October 1: Charles B. Gould, Charles E. Phillips, Ernest Blasser, James W. Flynn, Luke J. Hakey, David A. Finnegan, Joseph L Curren and Charles A. Hawes.

George Randell, a licensed plumber of Reading, Mass., and an inspector in the State, has opened a shop in the Wallace Block on South street, Milford, N. H.

A. J. Sampson has been granted a license as a plumber at Bangor, Maine.

The Mayor of Hoboken, N. J., will receive bids until October 27 for a hot water heating system for Fire Engine House No. 4.

R. T. Salyers of Middleboro, Ky., is engaged in a number of roofing and plumbing contracts at Cumberland. His contracts include two new buildings and a brick block.

F. W. Larney, Vancouver, B. C., has succeeded to the plumbing business of McCarthy & Larney. Mr. Larney has just finished a job in Masonic Hall of that town which is said to reflect credit on his skill.

George Drought has opened a plumbing, steam and gas fitting establishment on Butler street, Port Huron, Mich.

A Hartford, Conn., paper gives a list of a large number of plumbing, heating and gas fitting contracts which have been awarded to James Ahearn of that city, with the explanation that his success is due to the fact that he understands his business in all its branches, is progressive and never fails to give satisfaction to his customers. Some of the more prominent buildings in which Mr. Ahearn is doing work are St. Patrick's School, St. Francis' Hospital, Hart-

ford Public School, Brown's School Annex, St. Joseph's School, mechanical department of the Hartford *Times*, Travelers' Insurance Company Building, New Britain High School and a large number of private residences in some of which he is installing an electric lighting plant.

The half yearly meeting of the National Association of Master Plumbers of England will be held at Bradford on November 10. The English association is planned largely on the lines of the National Association of Master Plumbers of the United States, and is looked upon with high favor by the trade.

The Supervising Architect, Washington, D. C., will receive bids until October 27 for a steam heating and ventilating system for the Post Office at Saginaw, Mich.

The George P. Steel Iron Company, manufacturers of Steam and Hot Water Heating Apparatus, 330 Philadelphia Bourse, Philadelphia, Pa., have been succeeded by the George P. Steel Company, who continue the same line of business.

In the Circuit Court sitting at Huntington, Ind., Judge Watkins declared as unconstitutional the Huntington city ordinance providing that no one but residents of Huntington could obtain a plumber's license to do work in the city. The case came up on appeal from Mayor Cast's decision some weeks ago. The Mayor decided the same way, but upon the theory that a city council had no authority to pass such an ordinance. Robert Spice, a Fort Wayne plumber, secured the contract for plumbing the residence of the Rev. John R. Quinlan. He sent John O'Rourke to do the work and O'Rourke was arrested for working without first obtaining a license.

T. D. Barlow of the plumbing firm of Barlow Bros. Company, Waterbury, Conn., has been elected Mayor of that city.

Thomas F. Burns, Norwich, Conn., has just completed the installation of a hot water heating plant in Beach & Dudley's warehouse, Bridgeport.

The Hopson & Chapin Mfg. Company, New London, Conn., have been awarded the contract for the hot water heating in Col. A. C. Tyler's new residence.

The New England Engineering Company of Waterbury, Conn., have opened an office at 102 Orange street, New Haven, under the management of E. L. Stevens, who has represented the company in that section for some time past.

Sullivan & Wesley, plumbers, are building a four story block on High street, Holyoke, Mass.

Paul Bulow, a plumber who is known in Leavenworth, Kan., and Southern Illinois, opened a shop at Helena, Ark., about a year ago and reports that he has done a good business and has no report to make of hard times. He is now engaged on the plumbing and gas fitting for the St. John's P. E. Church.

The slot gas meters introduced a year ago by the gas company of Omaha, Neb., have proven as popular as the company could wish. In fact, the meters cost so much that the company are not eager to push them. Most are in restaurants, some in residences and a few in Ninth street resorts. A silver quarter buys about 200 feet of gas, and a provident consumer, when flush of money, can buy to the limit by putting in five quarters. Recently a consumer dropped in a 20-cent piece by mistake. The gas ran out, of course, and the company were notified the meter was out of order.

William Donnelly, who was appointed plumbing inspector of Ashtabula, Ohio, has opened a plumbing shop on Bridge street.

Rufe Brothers, manufacturers of the Rufe steam and hot water boiler, Doylestown, Pa., are installing a fine system of heating and ventilation of the indirect type in the residence of Hugh B. Eastburn.

Jaynes & Blagden, John and Pearl streets, New York City, are sending out a little circular devoted to the Eclipse and Perfection hydrants and street washers. They also make a specialty of a full line of supplies for steam and hot water fitters.

The New Britain Brass Company, New Britain, Conn., have filed a certificate of an increase in their capital stock from $10,000 to $25,000.

The Armleder Plumbing Company have been incorporated, with a capital stock of $15,000, at Cincinnati, Ohio, by J. A. Armleder, Josephine Armleder, Daniel McDonald, T. J. Mayer and H. S. Peck.

A local paper in commenting on the test made of the flushing water closet system installed by the Fuller-Warren Company, Boston, Mass., in the Highland school at Lowell, remarks that five bottles of peppermint, which has a pungent and far reaching odor, were poured into the drainage system, but not the slightest odor was perceptible anywhere in the building, to the great disappointment of some of the committee.

Blake & Williams, 364 West Broadway, New York City, bid $21,811 and secured the contract for furnishing the ventilating and heating apparatus for the new public school No. 63.

The plumbing establishment of T. Roth, Mitchell, S. D., was recently visited by a fire.

The Davis Company of Moline, Ill., bid $18,975 and received the contract for heating, plumbing and lighting the Illinois Western Hospital for the Insane at Watertown.

The Vance Boiler Works of Geneva, N. Y., recently shipped a large steam heating boiler for a large hotel at Butte, Mont., and two large boilers for a heating contract in Northern Ohio. They also show a testimonial letter in which the statement is made by the owner that by the use of the Vance boiler he has saved one-half of the former cost for fuel for heating his building.

The steam heating trade will be interested in a little catalogue issued by Augustus Eichhorn, Orange, N. J., relating to specialties in radiators, steam fittings and couplings. The first illustration shows a system of piping in which special forms of tees and elbows are used for connecting the radiators. Three other illustrations show different styles of radiators for steam and hot water heating, in which it is claimed their capacity can be adjusted to the requirements of the weather.

J. B. Colt & Co., 115 Nassau street, New York City, are issuing a 30-page pamphlet, entitled "Acetylene Gas: Its History and Utilization," which the plumber and others who are interested in furnishing plants for manufacturing gas for buildings which cannot be supplied from street mains of gas companies will find of interest. The pamphlet shows their acetylene gas generator, and incidentally the principle of its construction is described in the book. The book describes the materials employed and the construction of the apparatus so that the reader may readily judge for himself as to its adaptability for general use in isolated buildings.

The E. J. Nolan Plumbing Company, Cincinnati, Ohio, are sending out a circular letter announcing that E. J. Nolan of the former firm of Nolan & Armleder has connected himself with the company, and they are prepared to do all kinds of work in their line. Under Mr. Nolan's supervision the plumbing in the new City Hall, the Sisters of St. Francis Hospital and the Summerset, San Marco and Trevarren flats was done.

The Metal Worker enjoyed a call from P. H. Doyle of Ogdensburg, N. Y., Mr. Doyle being in the city visiting the manufacturers and jobbers dealing in plumbers', steam and gas fitters' supplies. Mr. Doyle does a large contracting business, and in addition carries a line of supplies and does a jobbing business with the local trade.

W. K. Pierce, president of the American Boiler Company, and C. C. Jenkins, treasurer of Pierce, Butler & Pierce Company, Syracuse, N. Y., were visitors at the New York office of the American Boiler Company this week.

The Doric Boiler in front of the New York office of the Gurney Heater Mfg. Company of Boston, Mass., is being treated to a new coat of carmine paint, the idea of the manager, I. G. James, being that this contributes only a feeble idea of the heat that his line of Boilers is capable of generating.

The George B. Cobb Company, 44 Centre street, New York, representatives of the Niagara Radiator Company, Buffalo, N. Y., inform us that the plant is now running overtime, and that Radiators of standard hights can be shipped promptly. They are displaying on their sample floor the Niagara Radiator and the Niagara Radiator with open end section and the Niagara Junior, all handsomely decorated in appropriate color bronzes. The Niagara Junior is also shown in curved form as used around a column in a wall for supporting a building.

Pierce & Cox of Boston, Mass., are opening a branch of their plumbing business in the O'Brien Building, on Beach street, Manchester, Mass.

The Thatcher Furnace Company, 240 Water street, New York, have just issued circulars of their newest production in the house heating Boiler line, which they call the Thatcher Safety Sectional Steam Boiler. It is made in five sizes for both steam and hot water heating, and rated to carry from 525 to 1200 feet of direct steam radiation and from 940 to 2150 square feet of direct hot water radiation. This construction presents a large fire surface and is of the horizontal return flue type.

W. M. Mackay, manager of the New York office of Hart & Crouse, Utica, N. Y., is installing for heating their office and warehouse, at 235 Water street, a heating system which will be of interest to those who have con-

tracts for heating apparatus which must be set on the same floor with the radiation. The job will be piped on the one-pipe system, and in appearance has a strong resemblance to a one-pipe steam job. A No. 37 Royal Hot Water Boiler is used in connection with it.

S. L. Beidler of Mount Pulaski, Ill., has placed a number of Acetylene Gas Generators and lighting systems in the buildings of farmers in his vicinity.

The Sportsman's Shot Works, Cincinnati, Ohio, are sending to the trade an attractive postal card giving the lastest quotations on Pipe and Sheet Lead. The cuts show their By-Metallic Traps in various styles, Lead Pipe in coils as prepared for shipment, and Sheet Lead as crated by them for transportation. The prices quoted evidently will be of interest to the plumbing trade and can be secured on application.

At a recent meeting of the manufacturers of Copper Bathtubs in New York a strong disposition was shown to advance the price of Bathtubs in accordance with the upward tendency of copper.

A special number of the Los Angeles *Times* gives a long and interesting account of the Fortuna Mines, operated by a company of which C. B. Boynton of the Boynton Furnace Company is president. The account also states that Colonel Boynton is largely interested in coffee plantations in Mexico. The Colonel, in all probability, will be pleased to learn that he is a capitalist of wide and successful interest at home and abroad. This disclosure of the Colonel's interest in gold mining may be an explanation of his activity in the Sound Money campaign of last fall.

Since the State of Minnesota has been examining the master and journeymen plumbers in the State, it has developed that in Minneapolis and St. Paul the larger hotels employ an engineer who does more or less plumbing work in the building, and the Master Plumbers' Association are pointing out that this is not in accordance with the laws.

The master plumbers of Bridgeport, Conn., recently held a meeting at the office of L. H. Mills. Among the subjects discussed was the annual banquet, which has become quite a popular feature of the association.

The Begent, Lynch & Swayze Company have been organized at Hartford, Conn., with a capital stock of $16,000, to do a general plumbing business, and the stockholders are H. L. Swayze, L. S. Begent and Albert Lynch, Mr. Swayze having a one-half interest in the company, the remaining half being divided equally between the other two stockholders.

W. O. Garrison of the Standard Radiator Company, St. Louis, Mo., visited John I. Leitch, manager of their New York office, at 208 Centre street, this week, and in company with him visited a number of the prominent representatives of the heating trade in the city.

E. J. Jenkins & Co., Portsmouth, Ohio, inform us that they have closed a contract to install a heating apparatus in the City Hall and the Fire Department Buildings at Jackson, Ohio, using heating apparatus made by the Boynton Furnace Company. They secured the contract, although their bid was the highest. They are also installing a similar plant in the residence of J. S. Dodge, at Rose Ridge.

William Lockwood, clerk of the Master Plumbers' Association of New York City, informs us of the death of Paul G. Decker, an active member of the association, whose place of business is at 3204 Third avenue, New York. He died at his residence last Tuesday. He was one of the largest employing plumbers in the city, keeping from 75 to 100 men engaged throughout the year. His funeral will be from his late residence, 875 Caldwell avenue, to-day at 1.30 p.m.

A. A. Spear, a familiar figure in the Chicago Stove trade by reason of his long management of the Western department of the Magee Furnace Company, but for some time a member of the Spear & Douglass Heating Company, has engaged in the heating business on his own account at 54 Dearborn street, Chicago.

Thomas & Smith, 16 North Canal street, Chicago, have secured the contract for installing the steam heating plant in the new Chicago Public Library Building. An apparatus for purifying the water is included. The amount of the bid was $10,000.

T. J. Douglass succeeds the Spear & Douglass Heating Company, at 42 Dearborn street, Chicago, retaining the agency of the Richmond Stove Company, Norwich, Conn., and continuing in the installation of heating apparatus.

Pictet, the plumber who was injured in saving life at the Charity Bazaar fire in Paris and who received a gold medal for his bravery from the Government, was recently married in great style. He had ordered a ninth-class mass for the ceremony, but the parish authorities gave him a first-class wedding gratis, decorating the church and providing music. Many of the relatives of the persons burned attended.

Geo. A. Kiley, Hazleton, Pa., writes that he has the contracts for heating a three-story building of John W. Zierdt and a building for Mrs. Josephine Campbell, at Freeland, Pa., with hot water.

The Association of Master Plumbers of San Francisco, Cal., has elected the following officers for the ensuing year : President, C. W. Iredale, re-elected ; vice-president, John B. Butterworth ; corresponding secretary, J. L. E. Firmin, re-elected ; financial secretary, George Dallamore, re-elected ; recording secretary, Charles McCarthy, re-elected ; chairman of the General Committee, F. Koch, re-elected ; sergeant-at-arms, F. Brooks ; trustees, William Quinn, A. Newmark, George Meehan.

The Ferguson Hardware Company, Sault Ste. Marie, Mich., have a force of men engaged on their plumbing contract at the Upper Peninsula Hospital, at Newberry, in charge of A. McMillan. The contract will be finished by December 1.

Report of Montana State Commission on Heating.

The fourth division of the report of the Montana State Commission on heating is devoted to the use of hot air furnaces for warming schools and is given below.

IV. WARM AIR FURNACES.

The furnace system of heating is an indirect system under all circumstances. It can be divided into three classes:

1. Heating by furnace without ventilation.
2. Furnace heating and ventilation by the gravity system, and,
3. Furnace heating and ventilation by mechanical or hot blast system and fans to control the circulation of air.

Objections are raised to all heating and ventilating systems, and the warm air system is not an exception. It is urged against the first mentioned system that the joints will open by expansion and contraction of the highly heated metal; that the gases will escape into the hot air ducts and in the rooms to be heated; that the air, in passing through the furnace, becomes superheated, thus delivering impure air into the rooms.

Furnace heating without ventilation has nothing to commend itself except its economy in first outlay and the cost of maintenance. It is not durable. It is not clean. The furnace usually delivers air at a high temperature into the room, and as no provision is made for the exhaust of the air, occupants are oppressed with foul air, overheated, subject to drafts from open windows, which will be pulled down at the top, &c. It is a familiar story, and previous suffering has bred a general prejudice against the very name of furnace. Furnace heating, by either of the other methods mentioned above, is quite another thing, and, like an indirect system of steam heating, if properly introduced and introduced in proper places, will give the best results.

The gravity system of furnace heating and ventilation is really an exhaust system, but to distinguish it from a mechanical exhaust system it is called a gravity system. The successful operation of both heating and ventilation is brought about by gravity, which always causes a cooler strata of air to fall by its weight (by the attraction of gravitation) and a column of hot air to rise, by rarification (heat). In this system the furnaces are placed in the basement, most properly at the base of the brick air ducts leading to the rooms to be warmed and ventilated. At the extreme bottom of these flues or ducts and in the sides next to the furnace is an opening for the admission of cold air, and at the top of the furnace casing is another opening into the same flue for the admission of warm air. At the bottom of the warm air opening is a valve to control the admission of the air to the room above. If the valve is placed in another position all cold air will enter the room. By setting this valve at any point between the two extremes the temperature of the air can be regulated to any degree between the coldest outside temperature and the warmest air in the furnace chamber. The valve is controlled by a regulator in the school room, and the occupants of each room are thus able to control the temperature of the room and change it to any degree required, independently of any other room in the building. While this valve regulates the temperature it does not reduce the air supply going into the room, the supply being constant under all circumstances or conditions of the elements outside the builidng. The valve in the schoolroom can be operated by either hand or automatic regulation. The air supply for the schoolroom is taken from outside of building into a cold or fresh air room which is of easy access and the air supply is easily regulated. The room should

be kept sweet and clean. This will insure the delivery of the air through the furnace into the schoolroom in as pure a condition as it is out of doors.

The furnace which warms the air must be capable of warming an immense volume of air, and so thoroughly doing its work that no one portion shall be so heated as to favor certain rooms; simple in its construction so that its operation can be readily understood by the average janitor; so constructed that all joints will properly adjust themselves to the varied conditions of heat and cold; gas tight, and have a radiating surface that is properly proportioned to its grate surface. Consideration of these facts proves conclusively that it is not the furnace which by its superior construction concentrates the heat, or the furnace in which an intense heat can be quickly obtained, but a furnace which spreads the heat most evenly over the largest extent of heating surface with slow combustion, which are the points to be sought for. The successful operation of all indirect heating systems depends on the ventilation of the rooms, for the reasons that the impure air must be exhausted from a room before the pure air can flow in. Thus we see that ventilation is an aid to the heating and proper heating is an aid to ventilation. We have examined a great variety of furnace heating and gravity ventilating apparatus in the different cities, many of them working to perfection. The last method of heating and ventilation we will consider is a mechanical or hot blast furnace system. The following elements go to make up the complete apparatus:

1. Warm air furnaces set in a central location in a battery or separately at the base of the heat risers.
2. A fan to force or draw the air through and over the furnaces, and force it into the building through ducts and flues or heat risers.
3. A motor, which can be either an electric motor or a gas or gasoline engine or a water motor, with which to drive the fan.
4. A suitable system of flues, valves and registers to deliver the heated air at the desired points and control its supply.

The plenum system keeps the air in the furnace chamber, the air distributing ducts and the air in the rooms under a slight pressure, in this manner forcing it out at the different outlets provided for the escape of foul air. The exhaust system is the reverse of this, as it exhausts the air out of the rooms, and at the same time pulls the air from the furnace into them. In the majority of buildings the plenum mechanical system is to be preferred to the exhaust mechanical system.

We can best describe a mechanical or hot blast furnace system of heating and ventilation by giving a detailed description of a heating and ventilating plant which we visited in our investigations. From anemometer tests we found that there were from 30 to 40 cubic feet of air per minute being furnished each pupil, in each room, to the full seating capacity of each room; that the temperature was uniform at the same hight from floor, and that the difference in temperature between floor and ceiling did not exceed 4 degrees. The heating and ventilating plant is a combination of a plenum and a gravity system, but we were informed that unless the weather was very cold and windy it is not necessary to run any mechanical appliances, as the building heats and ventilates perfectly by gravity exhaust. In extreme windy weather the mechanical appliances are used, and uniform heating and thorough ventilation are secured, no matter what the condition outside. The building is warmed by six masonry furnaces set in a battery, in a central location. The fresh air supply to the furnaces is through an underground fresh air duct connecting the furnace chambers to the fresh air room. The fresh air room is arranged to take air from two directions, west and north. The heat risers to the different rooms are of brick and are arranged to furnish either warm or cold air through the same register, the cold air connections to the risers being brick ducts underground and the warm air connections being galvanized ducts overhead. In the fresh air room is located a fan to force the air through the furnace to the different rooms. This fan is used only in extreme bad weather. The fan is operated by a 5 horse-power motor. This system of ventilation is reinforced by coils at the top of the ventilating stack, the air from each room being exhausted into a ventilating flue or flues, all of these flues terminating in the attic. There the ventilating flues are all connected with a central foul air chamber by galvanized iron ventilating ducts, and the air is exhausted from this foul air chamber to the outer air through a galvanized iron ventilating top, made double to keep it from chilling. This ventilating top is 8 feet 6 inches in diameter. The assembly hall is the hight of both the first and second stories of the building, and is furnished with a stage and seats for 460 people. It is arranged to ventilate from the floor in cold weather and from the ceiling in warm weather, to keep it cool. With this arrangement, by running the fan and forcing the air into the room at a high velocity, and exhausting the air from the ceiling in warm weather, it will keep the room cool and comfortable.

NEWS AND NOTES.

Bristol, England, is to have a new dock at a cost of $7,500,000.

The London correspondent of the *Daily Post*, of Birmingham, England, says that advices received from St. Petersburg announce that an arrangement has been come to between a syndicate there and several of the Abyssinian traders who are visiting Russia to establish near Harrar, Abyssinia, a factory for turning out cheap cutlery, hardware and various kinds of small machinery. The syndicate, which is Franco-Russian in character, and with which M. Leontieff is said to have something to do, will find the money, and the traders undertake to get for the factory certain privileges, and to push its wares in Abyssinia, receiving as compensation a small interest in the enterprise.

The latest English trade papers received assert that the whole interest for the construction of the Hankow-Pekin Railway and other important works in China, which a Belgium syndicate acquired some months ago, has within the past few weeks passed into British hands.

The French official customs returns for the first eight months of this year show the value of imports into France in that period to have been $521,953,000, as compared with $519,548,000 in the corresponding period of 1896.

Completed railway returns for the United Kingdom, just published by the British Board of Trade for 1896, show a substantial increase of about $25,000,000 in net earnings last year as compared with 1895, reflecting the improvement in general trade which was experienced in that country last year. The passenger traffic yielded over $195,000,000; freight traffic, over $230,000,000, and miscellaneous traffic, over $20,000,000, the grand total being over $445,000,000, as against $420,000,000 in 1895. The tonnage of freight traffic showed an increase for the year of 22,000,000 tons. The paid up capital on all British railway stocks on December 31, 1896, was $5,145,000,000.

The fire losses in the United States and Canada for the month of September, as compiled from the returns of the New York *Journal of Commerce*, aggregated $9,392,000, as compared with $6,454,950 in the previous month and $8,200,650 in September, 1896. This brings the total fire losses for the first nine months of 1897 up to $80,413,700, as compared with $90,880,700 for the corresponding period of 1896. The September record is swelled by eight serious fires, each contributing over $250,000.

The Grand Central Railroad Station in New York City is undergoing some important extensions and improvements, involving a cost of about $1,000,000. The enlargements are being carried out in such a way as not to interfere with the immense railroad traffic which enters and leaves the station. The present alterations will take some seven months to complete.

The regular October report of the *American Agriculturist* places the 1897 wheat crop of the United States at 589,000,000 bushels from an acreage of 39,167,000. For 1896 the yield was 470,000,000 bushels from 37,156,000 acres. The report says that the winter wheat crop is deficient in but two States, Illinois and Missouri, and that in every other State the rate of yield is above the average for a long series of years. The total wheat crop is, with one exception, the largest ever grown. The corn crop of 1897, on the contrary, is barely up to the average, owing to the serious decline in condition which took place during the month of September, the general average falling from 82.03 to 78.09. It is calculated that a total of 1,750,000,000 bushels will represent the outside figures of the crop. Last year's corn yield was 2,283,875,000 bushels.

A prominent smelting company in Monterey, Mexico, have notified their workmen that in future they will be paid in silver instead of gold, at the rate of two Mexican silver dollars for one of gold.

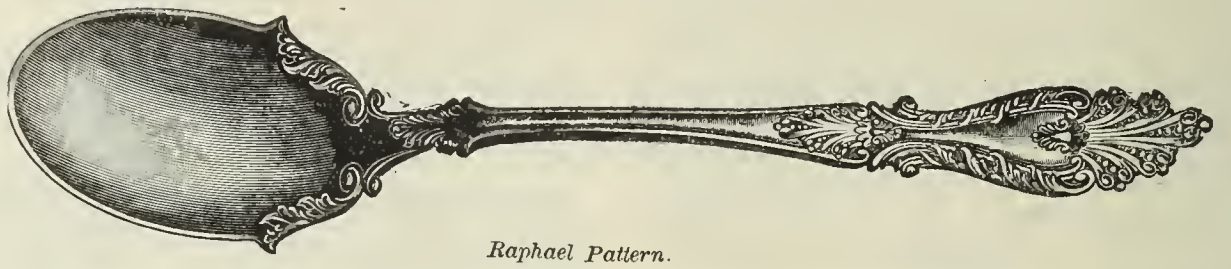
The stock of gold in the United States at the present time, according to the estimate of Mint Director Preston, is larger than ever before in its history. Mr. Preston calculates that on October 1 the gold in the country aggregated $712,660,000, an increase of $15,541,000 since August last, and larger by $1,000,000 than that reached in October, 1888, the greatest previous total. It is estimated that by the end of the current calender year there will be in the United States between $750,000,000 and $760,000,000 in gold, a grand total largely in excess of anything ever known.

A cable dispatch from London, England, states that the Executive Committee of the Amalgamated Engineers' Society threaten to withdraw the engineers in the ocean mail service in the event of a continuance of the present dispute in the British engineering trade. Such action, if carried out, would have a very serious effect on international commerce.

THE RETAIL STORE.

Raphael Pattern.

The Rogers & Hamilton Company, Waterbury, Conn., are marketing the Raphael pattern in flat ware recently brought out by them, the illustration showing an ice cream spoon, exact size. This particular design is made in the Rogers & Hamilton brand. A full line is made, including spoons and forks, and a large variety of fancy pieces for serving fish, meat, fruits, creams, &c.



Raphael Pattern.

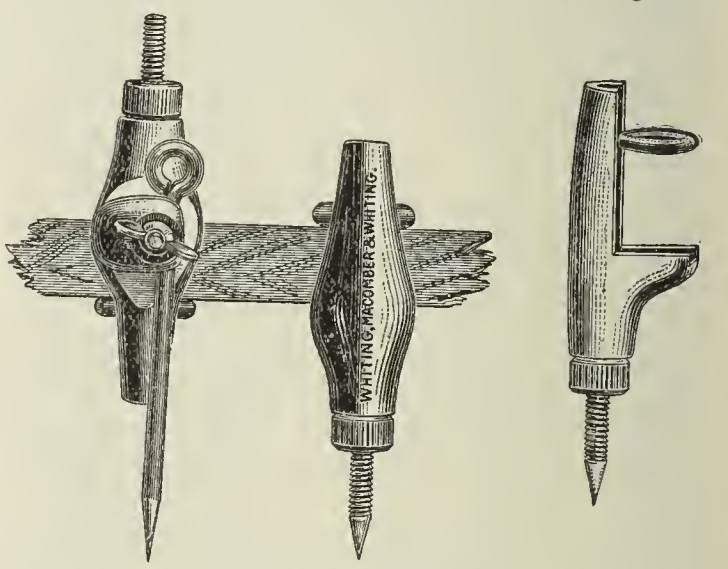
The Boss Sidewalk Cleaner.

The accompanying cut represents a sidewalk cleaner brought out by Withington & Cooley Mfg. Company, Jackson, Mich. The cleaner has a heavy steel blade, tempered and polished and set to a strong handle, the whole being neatly finished. The special shape given the blade adds much, it is stated, to the usefulness of the tool, as when it is held with the concave side toward the user it makes an excellent chopper, and by reversing it the blade hangs just right to slide under the ice to pry it loose or to shave it off the sidewalk. It is pointed out that the tool is made heavy for rough use, and that it is made without fancy finish so as to place it in the hands of everybody at popular prices.

The Boss Sidewalk Cleaner.

Whiting's Adjustable Trammel Heads.

Whiting, Macomber & Whiting, South Framingham, Mass., are putting on the market the trammel heads herewith shown, the detached one at the right of the illustration being a side view of one of the heads. They can be carried in the pocket, as no special beam is needed, the heads being readily adjustable to any strip of molding, yard stick, rule, lath or straight edge—in fact, it is remarked, to anything not over an inch thick, the width being immaterial. The heads may be used with the hardened steel point, and a slot is also provided in which may be inserted an ordinary lead pencil of any length, or a ruling pen, without removing the point. The clamp for the point and pencil is pivoted and is fastened by a thumb screw so as to allow a play of two or more inches for fine adjustment without moving the heads on the beam. In emergency these heads, it is explained, may be used as small head clamps. The makers state that in addition to the foregoing advantages the heads have all the usual features of the best tools of this class, that they are gotten up nicely for the use of manufacturers, architects, draftsmen, while the price is comparatively low in proportion to their scope and adaptability.



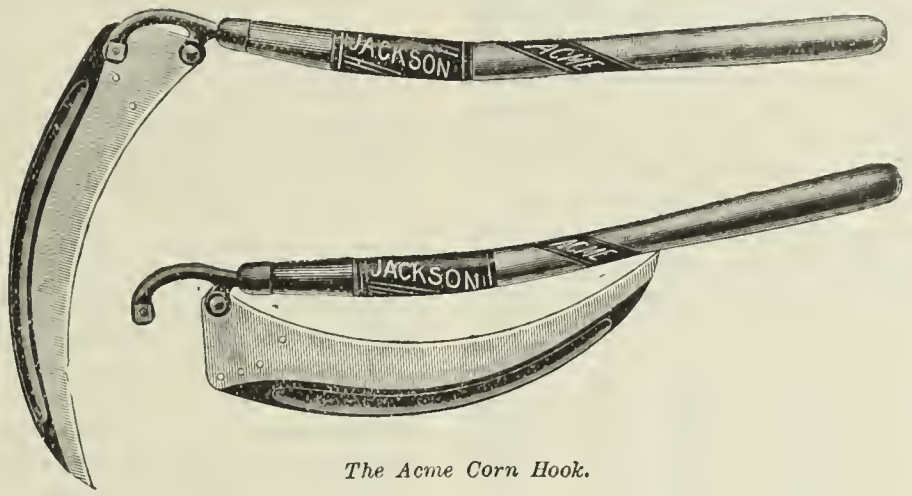
Whiting's Adjustable Trammel Heads.

Pike Mfg. Company, Pike Station, N. H., are representing the Chicago Pumice Company, Chicago, Ill., in the territory east of Buffalo in the different States. This company manufacture a fine grade of pumice in a number of forms, guaranteed to be pure and free from substitutes. Among their production is powdered pumice put up in packages of 1 and 5 pounds, as well as in bulk packed in barrels. There are also bricklets for toilet purposes and coarser work, such as scouring marble, tiling, mosaic floors, &c., the sizes being 2¾ x 1⅝ x 1 and 5 x 3 x 2¼ inches respectively. There is in addition an extra quality for toilet use put up one each in handsome pink boxes, the stone being oval in shape 3¼ x ⅞ inches.

The Hardware firm of H. W. Plambeck & Co., Moline, Ill., consisting of H. W. Plambeck and C. A. Berglund, have changed the style to Plambeck & Berglund. They have recently moved into their new store building, 1417 and 1419 Fifth avenue. The building is 40 x 90 feet, two stories, with basement. The first floor will be used as a salesroom, the basement for plumbing, while the second floor will be used as a tin shop and storage room for surplus stock.

The Acme Corn Hook.

The accompanying cuts represent a corn hook put on the market by Withington & Cooley Mfg. Company, Jackson, Mich. The hook is shown open for use, and closed for shipment and storing. The blade is ribbed and is referred to as of high grade knife steel and tempered each by itself, so that it may take a sharp edge. The attachment permits of a protection to the lower end of the handle by means of a ferrule and cap. The handles are also made with what is known as the apple knob on the upper end. This is to give a more secure grip for the user. The shank of the blade is made of steel, and the adjustable feature is described as perfect and the hang correct. The hook weighs 16 ounces, and they are packed in boxes of 1 dozen each. The point is made that the tool can be used as a hook or knife to suit the fancy of the user.



The Acme Corn Hook.

MEMORANDA.

The Toledo Tinware Mfg. Company, Toledo, Ohio, have just completed a thoroughly modern and well equipped Galvanizing plant in connection with their works.

The L. W. Hemp Mfg. Company, St. Louis, Mo., propose to put up a large Tinware factory in that city.

Patterson, Godfried & Hunter, 146 Centre street, New York City, are sending out a circular relating to the Snedeker Quick Adjusting Screw Vise, which should be of special interest to machinists and pattern makers. The circular shows broken views of the Vise, so that its movement can be readily understood, and gives a full explanation of its operation.

The G. W. Hazel Company of Church street, New Haven, Conn., made a very fine display of Stoves, Ranges and Kitchen Utensils, which they handle in great variety, at the third food exhibit, recently held at the Armory in that city. Prominent features of the exhibit were the Franconia and Art Royal Ranges, large numbers of which are in use in the city of New Haven and vicinity. The company also showed a full line of the Plymouth and Oakland Parlor Stoves, together with an interesting assortment of Cooking and Kitchen Utensils. One thing in particular which attracted much attention was a new Coffee and Tea Pot, with detachable handle which prevented it from becoming hot and burning the hands. A feature of the exhibit was the lectures by Mrs. Rorer on culinary subjects, and in her cooking operations the Franconia Range was employed.

Lewis & Gay, retail Hardware and Tinware, Wyalusing, Pa., have been succeeded by J. B. Lewis & Co., A. B. Lewis purchasing Mr. Gay's interest. The building which the firm occupy is a new one, having been opened on July 1 last.

Miller & Son have succeeded William Broughton in the retail Hardware, Stove, Tinware and Sporting Goods business, at Walnut, Kan.

W. A. Talmage is building a new Hardware store at Red Lodge, Mont. Mr. Talmage is a wholesaler and retailer of Hardware, Stoves, Tinware, Sporting Goods, &c. The building will be of stone, the main floor being 50 x 100 feet in dimensions. Mr. Talmage will use the Warren shelving.

In our trade columns this week details are given of an important cut in the price of Sheet Aluminum just made by the Pittsburgh Reduction Company. The reduction runs all the way from 6 cents a pound in the heavier gauges—the base price being lowered from 46 to 40 cents—to as much as 25 cents in the lighter gauges. This radical reduction in the price of the sheet metal is calculated to give a strong impetus to the manufacture and sale of Aluminum Kitchen and Household Utensils. The price of Ingots has also been reduced 3 cents a pound, No. 1 Aluminum, 99 per cent., pure, being quoted now, in 100-pound lots, at 36 cents instead of 39 cents.

L. Weaver & Co., Hico, Texas, have succeeded the Estate of A. F. Sellers in the Hardware business at that point. The stock comprises Shelf and Heavy Hardware, Stoves, Tinware, Sporting Goods, &c., in which a wholesale and retail trade is done.

The Secretary of the Navy at Washington has advertised for bids for the construction of a sailing vessel as a practice ship for the cadets at Annapolis Academy. The vessel will be bark rigged, of 1100 tons displacement, 175 feet long, 27 feet wide and 16½ feet draft. Although her motive power will be sail, she will be equipped with machinery for steering, also with dynamo, condensers, &c.

A private trial of the submarine wrecking boat "Argonaut," built by the Columbian Iron Works, Baltimore, Md., after the design of Simon Lake, the inventor, was made last week in the dry dock of the Columbian Iron Works, and is reported to have been completely successful. The "Argonaut" was submerged in 21 feet of water, remaining under the surface for two hours, during which time constant communication was kept up by means of a rubber tube with the six men who were in the vessel's cabin and engine room. The crew stated that during the entire time they suffered no inconvenience from lack of fresh air. A number of tests of the engines of the vessel were made, and while the trial was merely preliminary, it is claimed that enough was learned to make it certain that the boat will be able to perform the work for which she is designed—namely, the recovery of cargoes from sunken vessels and any other work of a submarine character.

The Union Iron Works, San Francisco, Cal., are building for the Pacific Coast Steamship Company a fine new 13 knot vessel for the company's Mexican route. The new boat, which is to be named the "Senator," will be 288 feet long, 38 feet wide and 21 feet in depth, and will carry 1500 tons dead weight. It is expected to be ready for service by next March.

At the annual meeting of the stockholders of the Amoskeag Mfg. Company, held at Manchester, N. H., last week, the report was made that on the whole the last year was the worst in the cotton manufacturing industry ever experienced, the corporation losing $123,382 as a result of the year's operations. The prospects, however, were reported as brighter than for some time past.

A new boat which has been recently added to the Havre-Rouen-Paris line of steamboats in France is fitted with gas engines, and is stated to be a complete success. The vessel is 100 feet long and 7 feet draft. It is divided into four water tight compartments, and has a two-cylinder 40 horse-power engine, capable of maintaining an average speed of 7 knots an hour. The gas for use in the engine is supplied from shore, and is stored in a steel holder with an accumulator composed of steel pipes under a pressure of 95 atmospheres.

Secretary of the Navy John B. Long has prepared and submitted to the Secretary of the Treasury, for transmission to Congress, the estimates for the support of the Navy for the next fiscal year. The aggregate to be asked for is $31,991,727, of which $8,565,000 is for increase in the naval force.

TIN PLATES.

Nine Months' Tin Plate Imports.

The official returns published by the British Board of Trade record the total September shipments of tin and terne plates from British ports to the United States as 4656 tons, as compared with 3526 tons in the previous month, and 7167 tons in September, 1896. This brings the total exports of Welsh tin plates to this country during the first nine months of the current year up to 64,746 tons, a decline of 25,787 tons from the figures of the first three quarters of 1896. The steady shrinkage which has taken place in the importation of foreign tin plate since the rise and development of the American industry is very marked. The following table shows the amount of such imports by months for the first three quarters of the five years, 1893-1897. The figures represent tons of 2240 pounds :

	1897.	1896.	1895.	1894.	1893.
January	8,810	11,861	18,626	18,296	23,498
February	9,678	6,980	23,201	13,413	20,190
March	10,358	8,903	18,743	16,907	31,334
April	8,146	10,903	15,946	13,210	31,651
May	6,916	9,222	18,118	21,291	26,988
June	7,172	11,753	13,760	17,247	26,759
July	5,484	13,930	16,445	17,805	22,248
August	3,526	8,814	23,531	19,125	15,784
September	4,656	7,167	17,507	17,672	13,789
Totals, tons	64,746	90,533	165,877	154,966	212,241

The Development of the Tin Plate Industry.

It looks as though capital were going into the tin plate industry with a rush, which may seem inexplicable when the low prices are considered at which tin plate has been sold for some time past. Since the publication of *The Metal Worker's* quarterly tin plate lists, October 2, which showed a total of 233 mills, finished or building, some important additional enterprises have started and others are talked of, among them being the 30-mill plant of the Shenango Company, a four-mill plant at Johnstown, Pa.; a six-mill plant at Martin's Ferry, Ohio; a four-mill works at West Leechburg, Pa., and an eight-mill works at Sharon, Pa This means an additional capacity of at least 1,250,000 boxes per annum, so that we are amply able to cover our own requirements.

There is a tendency developing toward concentration of the business in larger plants. The unit of product so far as tin plate manufacture is concerned is very small, being about 25 to 30 tons per mill per week. At the other end, the steel works and the tin plate bar rolling mill, the unit is relatively very large. A modern Bessemer plant is not doing much if it is not turning out 5000 to 6000 tons per week, while the unit in open hearth steel manufacture, a 30-ton furnace, will cast 350 tons of ingots a week, and a four-furnace plant is probably as low as any one would go in designing works. A modern sheet bar mill rolling in one heat from the ingot could easily take care of 2000 to 2500 tons per week. At the first blush it would seem natural, therefore, that the manufacture of tin plate bars would be confined to the large steel works, because they alone could handle such large quantities to best advantage.

But the matter seems to be working in a somewhat different way. Some of the tin plate makers have started in to make their own steel, and naturally choose the open hearth furnace, because it is a smaller unit, and because it is supposed to possess other advantages. Such plants must grow at the tin plate end in order to run the steel plant and the ingot rolling plant to best advantage.

The industry has been attacked also on the other end, particularly by Bessemer plants who must seek an outlet for a part of their tonnage. The temptation to add a tin plate department is great, and naturally in that case the undertaking is gone into on a relatively large scale. All this contributes to a lowering of cost which more firmly intrenches our young American industry. It has, besides, made marked progress in technical details and in management over the practice of the Welsh competitors.

The Johnstown Tin Plate Company.

J. W. Place of J. W. Place & Co., bankers, 69 Wall street, New York, advises us that arrangements have been concluded with the Johnstown Board of Trade for the erection of the proposed tin plate works at Johnstown, Pa., in which his firm are interested. A contract has been placed with the Totten & Hogg Iron & Steel Foundry Company, Pittburgh, Pa., for the entire plant from the ground up, including a structural steel building, boilers, engines of the improved Ætna-Corliss type, pumps, rolls, furnaces, cranes, floor plates, heaters, mills, shears, pickling machine, &c. Work on the foundations for the building has already begun, and it is expected that the entire plant will be finished soon after January 1 next. Two hot mills will be installed at first and four more will be added soon after, making a six mill plant. A suitable equipment of tinning machinery will also be put in, the company proposing to tin their own black plate for the market. Associated with J. W. Place & Co. in the enterprise are N. D. and J. D. Lewis, who were formerly engaged in the manufacture of tin plate in Wales, and who have recently been connected with the Great Western Tin Plate Company, Joliet, Ill., N. D. Lewis having been superintendent of that concern. The corporate title of the new enterprise will be the Johnstown Tin Plate Company.

The Shenango Tin Plate Company.

The principal contracts have been placed for the new tin plate plant to be erected by the Shenango Tin Plate Company at New Castle, Pa. Reference to the plant of this concern, which will be the largest in this country, has already been made in these columns. The contracts already placed call for the building of 30 hot mills and 28 cold mills, the latter to be driven tandem. The hot mills will be 26 inches in diameter and vary in length from 30 to 36 inches. The cold mills will be 22 inches in diameter and from 26 to 36 inches long. The contract for these mills has been placed with Mackintosh, Hemphill & Co. of Pittsburgh, and they are to be completed in four months from the time of signing the contract. The order for the engine to drive the mills has been placed with J. Weidman Murray of the Pittsburgh office of E. P. Allis & Co., engine builders, of Milwaukee, Wis.

As already noted, the contract for the buildings, which will be of steel and iron, has been given to the Shiffler Bridge Company of Pittsburgh, but the actual dimensions of these buildings have not as yet been determined upon. There will be one main building, containing the hot and cold mills, which will be probably 1600 feet long, although it may be divided into two sections. There will be another building about 600 feet long, and other smaller buildings containing boiler house, engine room, &c. It is expected to have this plant ready for operation about April 1, 1898, although the work of construction may extend beyond that date, depending largely on the kind of weather during the winter.

The stockholders of the Shenango Tin Plate Company are largely identified with and owners of the New Castle Steel & Tin Plate Company, Shenango Valley Steel Company, New Castle Wire Nail Company and two blast furnaces at New Castle, and negotiations are now under way looking to a consolidation of all these interests into one

concern and under one management. There are a great many details yet to be arranged, but it is probable the consolidation will be effected between now and the first of the year.

SCRAP.

"The whole thing in a nutshell" is the quotation on the back of a blotter illustrated with a nutting woodland scene, the blotter being issued by the Follansbee Brothers Company, Pittsburgh, in the interest of Scott's Extra Coated Guaranteed Roofing Tin.

The Humbert Tin Plate Company, South Connellsville, Pa., are considering the advisability of increasing their works to a six-mill plant. The mill buildings and machinery were originally planned and put up with a view to the ultimate enlargement of the plant from four to six mills.

A press dispatch from Sharon, Pa., states that the Tin Plate works which were in contemplation at that place will soon be erected. The company engaged in the enterprise are said to be composed in the main of local capitalists, but some outside parties are also interested. It is proposed to put up a ten-mill plant near the Sharon Iron Works.

We are advised by the Lalance & Grosjean Mfg. Company, New York City, that the report that they have decided to enlarge their Tin Plate plant at Harrisburg, Pa., by the addition of more hot mills is unfounded. Should business require an extension, they may do so later on, but at the present time the company are not contemplating any move in that direction.

A scarcity of Charcoal Tin Plate is reported in Canada, stocks being generally very light throughout the Dominion. It is regarded as doubtful whether orders recently placed with the Welsh makers for this material can be filled before the close of navigation. Consequently the scarcity is likely to become still more pronounced during the winter.

The contract for the construction work on the new 30-mill Tin Plate plant to be erected by the Shenango Tin Plate Company, near New Castle, Pa., has been awarded to the Shiffler Bridge Company, Pittsburgh, Pa., at a figure slightly over $90,000. The contract calls for two immense brick and steel buildings, the main one being 1650 feet long by 100 feet wide and the other 700 feet long by 60 feet wide. The buildings are to be completed by January 1. Contracts for a large part of the machinery and equipments are likely to be placed within a few days. The site for the plant will probably be south of New Castle, between that city and Mahoningtown. There is some thought of building an open hearth plant in connection with the works.

The American Tin Plate Company on the 4th inst. began the construction at Elwood, Ind., of two additional hot mills, which will make their works at that place a 20-mill plant. They also have six mills at Montpelier, Ind.

The Riter & Conley Company of Pittsburgh have the contract for the new buildings for the West Leechburg Steel & Tin Plate Company, to be erected at West Leechburg, Pa. The main building will be 100-foot span by 225 feet long by 20 feet high to the square of roof, and the boiler house is 34-foot span by 48 feet long by 14 feet high. The main building is to have brick wall 6 feet high and 175 feet long on each side. The balance of sides, gables and partitions to be corrugated iron and the roof is to be covered with sea green slate on wooden sheeting. Two partitions will extend entirely across the building, dividing same into a furnace room 50 x 100 feet and cold mill room 150 x 100 feet and machine shop 25 x 100 feet. Continuous sliding windows are provided on the side and swinging windows in a monitor 30 feet wide running the whole length of the building. The boiler house is to be of simple but substantial construction and entirely covered with corrugated iron.

In the Welsh Tin Plate industry production is still very much reduced, there being a large number of mills standing idle through strikes and disputes. Among them are several works that it is feared have come to a permanent stoppage, and will have to be reconstructed before they can be set going again, if ever the demand for Plates will sufficiently arise from other countries to make up for the loss of trade with America.

The Ellwood Tin Plate Company, Ellwood City, Pa., have ordered from the Whiting Foundry Equipment Company, Harvey, Ill., a traveling crane of 6000 tons capacity with compressed air motor and two air hoists.

The Ætna-Standard Iron & Steel Company, Bridgeport, Ohio, who recently took over the Bessemer steel plant of the Junction Iron & Steel Company, at Mingo Junction, Ohio, will remodel some departments of the plant and add considerable modern machinery.

The rate of freight on sheet bars and tin plate bars from Lorain, Ohio, to Cumberland, Md., has been established at $2 per gross ton.

At the annual meeting of the stockholders of the Canonsburg Iron & Steel Company, Canonsburg, Pa., held a few days ago, H. H. Nieman was elected president, H. S. Duncan vice-president, John F. Budke general superintendent and L. A. Meyran secretary and treasurer. It is reported that the company's Tin Plate plant is running full in all departments with a large number of orders on their books.

At the time when the Dingley Tariff bill was under discussion and the fate of the rebate clause in connection with re-exported Tin Plate was in the balance, there was much talk of the likelihood of the Standard Oil Company putting up an immense Tin Plate plant to manufacture their own material for the cans in which their oil is exported, in the event of the drawback being disallowed. The passage of the new Tariff law with the rebate clause incorporated in it seemed, however, to have laid the rumor to rest. Recently the name of the Standard Oil Company has again been brought forward in this connection. A well defined rumor, which has gained wide newspaper currency, credits that huge corporation with the intention of erecting a Tin Plate plant on a very extensive scale on their property at Hite's Station, on the West Penn division of the Pennslyvania Railroad, at a point on the Allegheny River opposite New Kensington, Pa. The company have a disused oil refinery at that place, which they are now dismantling and tearing down preparatory, it is said, to clearing the ground for the erection of a 24-mill Tin Plate plant thereon. Inquiries at the headquarters of the Standard Oil Company in New York City have failed to secure a corroboration of the report, however, and it is generally discredited by authorities in the trade.

It is reported that the Berger Mfg. Company, Canton, Ohio, manufacturers of Sheet Metal Roofing, Cornices, &c., are adding a tin house to their establishment. One tinning stack will be in operation by November 1. The company propose making a special grade of Terne Sheets in long lengths.

Perforation of an Iron Plate by a Clay Plug.

A curious illustration of the power of light matter to perforate more substantial substances when driven at a high velocity is described by the *Engineer* as having occurred in the Royal Arsenal a few days ago. In the course of experiments on firing gas in mines, conducted by Captain Cooper Key, a special gun is employed to do duty for a bore hole with a charge of high explosive, and pressed cylinders of raw dry clay 3 inches long and 1⅞ inches in diameter are used to represent tamping. These "shots" are made to act in various mixtures of air, coal dust, gas, &c., and to stop the course of plug, &c., eventually a cast iron target plate 1 inch thick was placed 25 feet in front, at an angle of 45 degrees, in order to break up everything into dust and throw it upward. After three or four shots with this arrangement the clay plug, weighing 7½ ounces, perforated the inch iron plate, and the hole thus made has been steadily extended since. The familiar tallow candle passing through a door must hide its head before a 7½ ounce plug of clay perforating an iron plate an inch thick at an angle of 45 degrees. Doubtless the velocity must be tremendous. The calculated velocity for a hard cylinder of this weight and size to cut through an inch wrought iron at 45 degrees would be over 1800 foot seconds. With cast iron and clay and the three or four repeated blows everything is so greatly altered that there is little more to be said than that the effect is remarkable and unexpected.

A cable dispatch from London, England, says that the secretary of the Federated Trades, comprising 30 important industries, announces that the Executive Committee has definitely decided to call out all its members, in sympathy with the struggle of the engineers against their employers, on Friday next, when, it is estimated, a total of 400,000 men will be out of work on account of the great labor dispute.

Plans are being formed for another electrical exposition to be held in the Madison Square Garden, New York, in the month of May, 1898. A company for the purpose were incorporated last week at Albany, N. Y. M. Nathan, the general manager of the last electrical show, will have charge of the forthcoming exposition.

The semi-centennial of the city of New Bedford, Mass., is being celebrated this week. The central feature of the celebration is an industrial exposition, illustrative of New Bedford's prominence in the manufacturing world, which was opened on Monday. President McKinley touched a button at Washington and set the machinery in motion.

STOVE TRADE NOTES.

COKE AS A DOMESTIC FUEL.

We print an article this week from the "Weekly Letter of the Anthracite Coal Operators' Association," which will interest stove manufacturers, more especially those in the East, for it has to do with the question of substituting other fuels for anthracite for domestic purposes. Anthracite is practically the only coal known to domestic economy in the East, and the average householder, unless he happens to be interested in manufacturing lines, really forgets that there is such a thing as bituminous coal in existence. But though soft coal is not used in Eastern households, the fact remains that it is the great fuel of the country and of the world, and that hard coal is of small importance in comparison with it. The objections to soft coal are plain, and where anthracite can be obtained at a reasonable figure the former fuel, with its dirt and heavy smoke, choking flues and polluting the atmosphere, will not gain a foothold. If, however, the experiment of a by-product coke plant to be erected near Boston, producing what is known as a soft or semi coke, is carried out successfully, and the coke is pushed in the New England market as a fuel for domestic purposes, it must have an important effect on the anthracite trade and may force some modification in the planning and construction of cook stoves and heaters. To the ordinary oven coke there are certain real or fancied objections which have prevented its general introduction. Even this hard coke, however, is not a novelty in heating or cooking, but nowhere that we know of has its adoption become general, though soft coke from Pennsylvania ovens is used to some extent for these purposes. The general objection is that coke is harder to light, that it makes a hotter fire than coal, and that it requires more frequent replenishing. It is not impossible, however, that the proper regulation of air would temper the heat to the average of a coal fire, and that controlled in this way the fire would last reasonably long.

It is well to bear in mind in this connection that the housewife, or whoever attends to the fire, is apt to measure the consumption of fuel by the number of scuttlefuls a fire takes, and this standard of comparison would be very much at fault where coke is concerned, as it averages perhaps not more than half the weight of coal, bulk for bulk. If the experiment in making semi-coke for fuel be successful near Boston it will probably be repeated in the neighborhood of other large cities, and there is no reason why, if turned out at a comparatively low figure through the utilization of the by-products, say at one-half to two thirds the cost of anthracite, it should not supplant that coal in the East. Of course, one important fact to consider is that in any form it is a new fuel, and the people of New England, where it is proposed to introduce it, are more conservative than those living in the West; so apart from coke's efficiency and cheapness as a fuel there will be the great trouble of making the people take up with coke merely because it is new.

Circulars which are being distributed by J. A. Woodruff & Son of Salem, Ohio, call attention to several of their specialties in the heating and cooking line, prominence being given to the Salem Hot Blast Parlor Stove, made in two sizes, for which strong claims are made. The air is admitted in front, passing both ways around the fire pot to a point in the rear of the Stove, where an opening in the center ring allows the air to pass upward and under the shield above the fire pot, admitting it to the fire in a highly heated state. The Stove is made with cone center clinkerless grate, air tight steel body and nickel trimmings The Excelsior Range also receives attention, this being offered in attractive dress in two sizes. It is intended for burning wood or coal, and one of the features to which the manufacturers refer especially is the large feed opening. Other interesting points are sectional top, oval fire box, extra heavy linings, draw out hearth, deep ash pit with ash pan and heavy cut top long center.

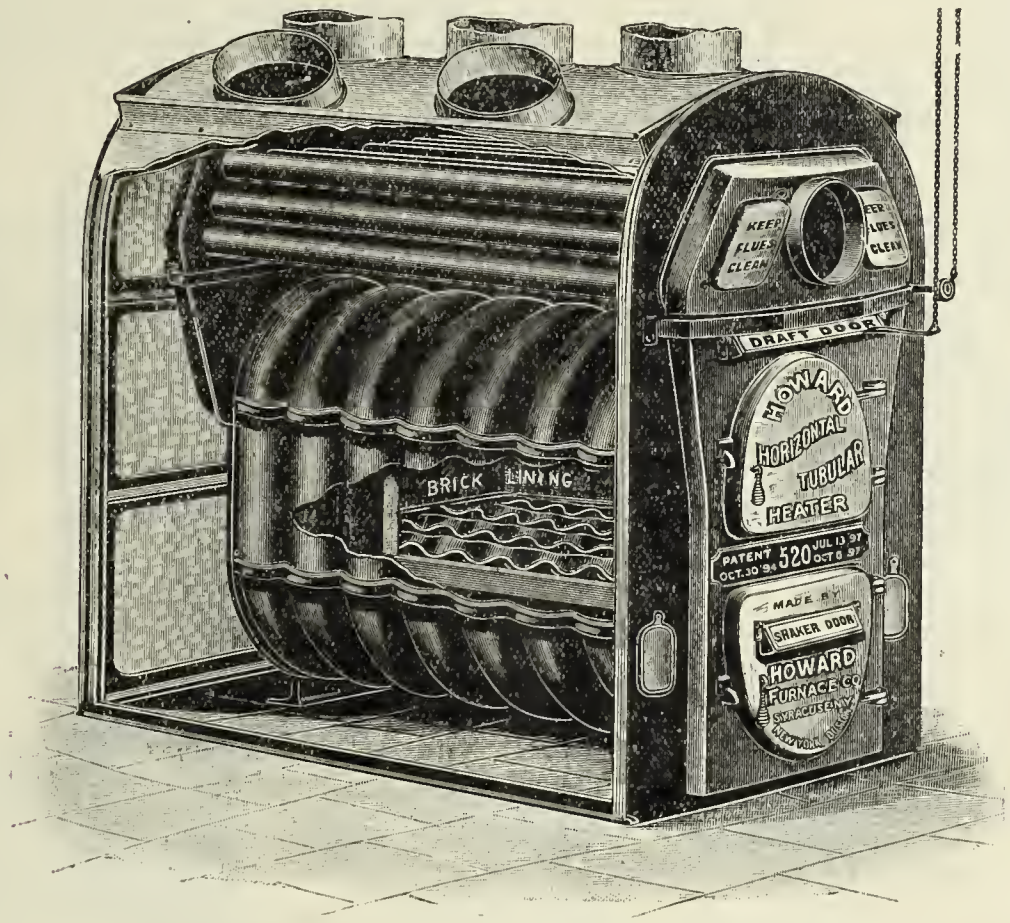
Foundrymen's Defense Association.

At the regular monthly meeting of the Foundrymen's Association held at the Manufacturers' Club in Philadelphia on Wednesday, October 6, W. H. Pfahler, chairman of the Committee on Defense appointed at the convention of the National Foundrymen's Association recently held at Detroit, addressed the gathering in regard to the progress made by his committee. He said: "Acting under the instructions of the convention the committee appointed to canvass the matter have been in correspondence with a large number of manufacturers, nearly all of whom they found evinced a desire to take up the subject and work out the problem of defense. There seems to be no doubt in the minds of those we have corresponded with as to the advisability and little doubt as to the practicability of the formation of a defense association. I called a meeting of the committee here about two months ago, and after a two days' session we believe we reached a line of formation which will be acceptable to the foundrymen. We at once commenced correspondence with about 200 of the leading foundrymen of this country, selected at random, asking them if they were sufficiently interested in the matter to attend a meeting for a discussion of the subject. Although that invitation to a discussion has only been out about ten days, we have already over 100 acceptances. I have, therefore, called a meeting to be held in Cincinnati at the time of the meeting of the Western Foundrmen's Association the week after next, which will get those founders located west of Ohio to attend, and in November we expect to have a meeting in the East. Between those two meetings we have little doubt but what we can formulate a plan which will be acceptable. It is the purpose of the committee after those two meetings to have a general meeting for the purpose of adopting by-laws and putting the association in working shape. I found in New England especially, where there was formerly a great aversion to anything of the kind, the strongest advocates to-day in favor of an organization which will be counter to the organization of the employees, and the idea that such an organization as the former must be antagonistic is dying out, because to-day the warmest advocates in its favor are to be found among the laboring men themselves. They realize that in an organization such as contemplated they will have a strength against agitation and the agitators, who are in the minority always in the labor columns. There is not 20 per cent. of the members of the Molders' Union to-day who are in favor of a strike, and yet that small percentage could bring about a strike. With the manufacturers organized they will have a support which is always maintained. The committee are very much encouraged with the work that has gone on so far, and I hope after the meeting in Cincinnati to be able to report a great deal of progress."

"Sure Winners for Fall" is the suggestive title of a folder just issued by the Eclipse Stove Company, Mansfield, Ohio, the winning feature being further emphasized by a panel picture at the top of the front page representing a football game in progress with the ball dangerously close to one of the goals. The features, however, that will interest the Stove dealer are found in the shape of new lines of Cooks and Ranges, some adapted for using wood only and others intended for burning coal. The Leader Eclipse, four-hole wood Range, has new decorative features of modern design and is made in two sizes. The Beacon Eclipse is similarly ornamented, but is intended for burning coal. Illustrations are also given of the Globe Eclipse Wood Cook, Comet Eclipse Coal Cook, Triumph Eclipse Steel Range, Postal Eclipse Cook, Peerless Eclipse Coal and Wood Cooks, Herald Eclipse Sheet Iron Air Tight Heater, made in two sizes; Perfect Eclipse Coal Stove, made in four sizes; Mars Eclipse Junior Oak, made in five sizes; Carbon Eclipse Air Tight Parlor Heater, made in three sizes, and the Matchless Eclipse Wood Base Heater, made in two sizes. The company are also distributing a blotting pad having a smooth face and embellished with illustrations of a Cast Iron Range and a Steel Range. Accompanying the illustrations are invitations to send for catalogues and discounts and suggestions about business.

The Howard Horizontal Tubular Heater.

A warm air heater of novel construction, simple in its arrangement of parts and provided with the most economical and labor saving attachments, has just been brought out by the Howard Furnace Company of Syracuse, N. Y. The body is made in cylindrical form, corrugated, the lower part forming the ash pit, the middle section the fire pot, which extends the entire length of the heater, and the upper section the dome. At the rear end of the heater a connection is made with the tubular radiator, which surmounts the body, and through which the products of combustion pass to the front and thence escape to the smoke pipe. The radiator is made of a series of 2¼-inch boiler tubes, the combined area of which is equal to the area of the smoke pipe, so as to insure the positive use of every tube, with the resulting utilization of all the radiating surfaces. The broken view of the heater which we present in the accompanying illustration gives an idea of the general arrangement of parts. It will be seen that there are three rows of tubes one above the other, so arranged that the air to be warmed is obliged to pass in a circuitous manner between the tubes, which are 1 inch apart. In making the radiator, as well as other parts of the heater, ample provision has been made for expansion, thus insuring a gas and dust tight construction. The check damper, which also acts as a dust damper, is located near the top of the hollow front, and when opened forms a connection between the ash pit and the front radiator head. The manufacturers refer to the ease with which this furnace can be cleaned, the opening of two doors in the front radiator head giving access to all the tubes. The fire pot is lined with brick, the construction of which is such as to form a hot air blast, which not only increases the heat but prevents smoke from soft coal. When it is desired to use wood as a fuel no lining is placed in the fire box, but the same grate is employed as in the case of coal. The hollow front is made on the well known air tight principle, which insures the holding of a wood fire an unusual length of time. The line of heaters here illustrated is fitted with the company's new four-bar corrugated grate, which embodies new features of construction. It is made in corrugated form with four projections, or spines, every other corrugation on each spine or projection having a perforation to admit air. By reason of its peculiar shape the grate bar is very strong, thus lessening the liability of warping and burning out. The bars rest in a removable frame, which in case of repairs can be easily taken out and new bars substituted without the use of a bolt, screw or key. The Howard horizontal tubular heater is at present made in three sizes for hard and soft coal and three sizes for wood, in portable form only, also three sizes combination warm air and hot water. The manufacturers inform us that three larger sizes are in course of construction, and will be ready next spring. Every Howard furnace has a special brush for cleaning the radiator, a sanitary porcelain lined vapor pan and the Howard patent silver aluminum damper regulator with tested thermometer.



The Howard Horizontal Tubular Heater—Broken View.

Chicago Stove Trade.

The demand for stoves at Chicago has shown decided improvement within the past week. Much depends upon the weather in the stove trade, and for four weeks or more the persistent mildness of the season undoubtedly proved a potent factor in withholding orders which should have been sent in to the manufacturers by dealers. The drought also had a deterrent effect, as farmers had begun to fear that it would be prolonged until serious damage would be inflicted over the entire West. Copious rains have relieved the situation, the air is more bracing on the prairies, and again stoves have come in favor. A sharp cold wave would, it is believed, result in a perfect avalanche of orders, as stocks in dealers' hands are known to be very small.

John P. Ley, the New York representative of Charles Noble & Co of Philadelphia, Pa., has some new attractions at his sample rooms, at 239 Water street, New York. The trade who have used the Busy Bee Range for a number of years will be pleased with the new dress in which it is now presented. This popular Range has a new design, is ornamented with nickel and retains all of its well-known excellencies. The Liberty Oak has been set up in the store by Mr. Ley, so that it can be shown in operation to those interested in this popnlar type of heating Stove. He is also preparing to make an active campaign on the Game Oil Heaters. These Heaters are attractively ornamented with nickel, show a large mica illumination and have given evidence of a substantial heating capacity.

George W. Starrett, Beekman and Water streets, New York, is calling the attention of his trade to Moore's Air Tight Heater, the Richmond line of Ranges, and the Craig Steel, for which he is the New York representative. He points to a Craig planished steel smoke pipe used in connection with a combination Hot Air and Hot Water Heater, which also has a steel radiator, and which has been in use for five years. The stove pipe runs horizontally along the ceiling for quite a distance, and shows little evidence of having been so long in use.

HEATING AND VENTILATING A RESIDENCE WITH HOT AIR FURNACE.

When so much is heard on every hand to the effect that furnace work is deteriorating owing to the seeming impossibility of getting people to pay for the best work, it will interest all in the trade to learn of cases where, in addition to paying for good work, the necessary outlay for a ventilating system has also been made. The need of ventilation with a hot air plant has been frequently pointed out, for it is difficult to get a sufficient flow of warm air into a room to secure a comfortable temperature when it is already full of air for which there is no escape. With this fact in view, the advantage of a system of ventilation in connection with a hot air furnace is so apparent that it would seem only necessary to thoroughly explain it to bring such a system into general use. It has always been a strong point for furnace heating that a building could not be heated by a furnace unless there was a continual inflow of fresh, warm air to maintain the desired temperature, and a corresponding leakage from the room of the air that was already in it—which is, in effect, ventilation. A proper system of vent flues will greatly aid this result and give a corresponding improvement in the quality of the atmosphere in the building in which it is used.

Through the courtesy of E. R. Rayburn, Columbus, Ohio, we are enabled to present plans and the following description of a heating and ventilating system designed by him and installed under his supervision in the residence of J. C. Munger, Xenia, Ohio. It has now been in operation two winters and has demonstrated its advantages to the satisfaction of all concerned. A plan of the basement is given in Fig. 1, showing the location of an all cast iron portable furnace of the circular radiator type, which has a 50-inch casing, a grate about 25 inches in diameter, and which exposes, by actual measurement, 52 square feet of heating surface in the fire pot, dome and flue section. The plan also shows the air supply, the heating pipes and the ventilating shaft, which is the feature of this plant. This shaft above the foundation is a single brick in thickness, with a brick laid across the corners to strengthen it. The bricks are laid in cement and the inside of the shaft is also smoothed with cement to reduce the friction.

The shaft is 20 x 24 inches in size, and owing to the 8-inch tile smoke stack running through it the effective area is reduced to about 417 square inches. The smoke stack is made of lap joint tile, put together with cement and tied to the brick shaft by 1 x ¼ inch iron braces, as shown in Fig. 2, which is a sectional elevation of the lower part of the shaft. The weight of the stack is supported on an elbow built solidly into the base and which serves as a clean out, the smoke pipe being connected into a tee joint, as shown. The products of combustion from the furnace passing through the stack warm the flue and induce an inflowing current of air from all the rooms on starting the fire. In order to prevent air from one room passing across the flue to another, tin boxes curved at the bottom and open at the top are placed in the shaft back of the registers, as shown in Fig. 2, to insure an upward passage of the air drawn from the rooms. The top of the ventilating shaft is covered by a galvanized sheet iron cap placed 8 inches above the brick work and fitted tightly around the tile so as to prevent water from coming in contact with the tiles where heated and causing them to crack.

Those rooms not adjacent to the shaft are connected with it by means of tin flues running up, from registers near the floor, in the partition to the attic and then over to the shaft. It will be seen on comparison that the ventilating shaft has an area equal to nearly three-fourths of the hot air inlets, and when it is considered that the air enters the rooms from the furnace at a temperature of about 150 degrees, more or less, and falls to a temperature of 70 degrees before leaving, the contraction in bulk will

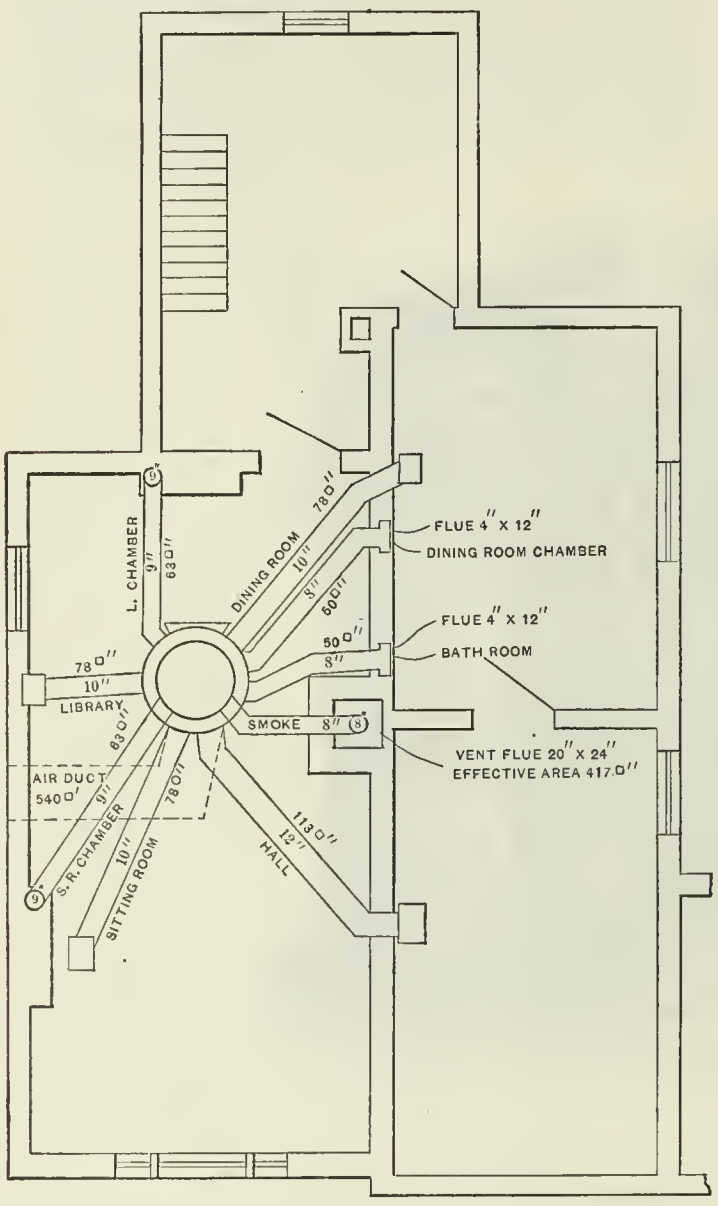


Fig. 1.—Plan of Cellar, Showing Furnace, Size and Area of Piping and Ventilating Shaft.

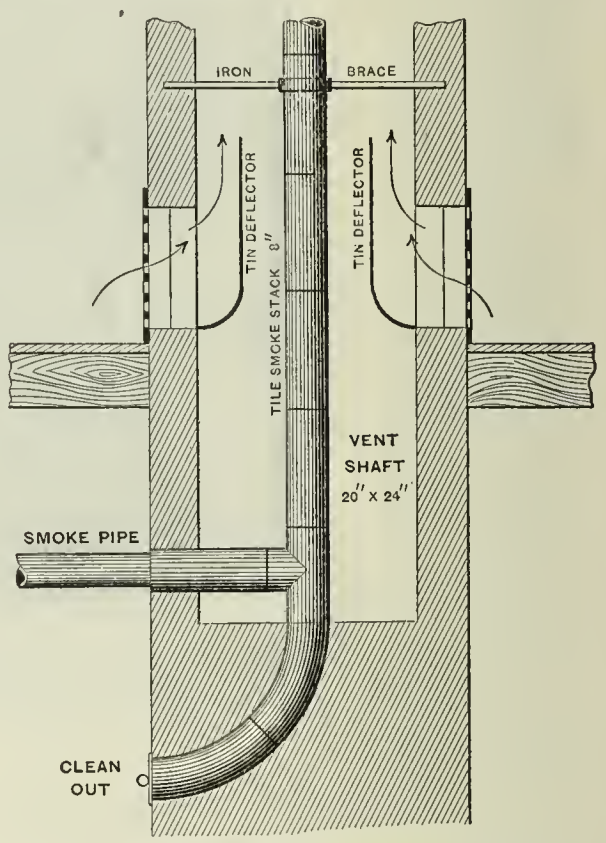

Fig. 2.—View of Ventilating Shaft, Showing Detail of Construction

HEATING AND VENTILATING A RESIDENCE WITH A HOT AIR FURNACE.

compensate for the seeming lack of capacity in the shaft. Mr. Rayburn, who does not claim this plan as a new idea, states that a practical test has demonstrated that the ventilation is thorough, and that therefore the heating is more positive, while the extra cost, considering the advantages, is small. He further says that he would urge upon any one thinking of putting in an apparatus on this plan the necessity of using a large heater and a plentiful air supply. It will be noticed from Fig. 1 that the air supply is 540 square inches in area and that the combined hot air outlets are 573 square inches in area—a much more liberal proportion than is generally provided. It will also

lent glass surface in square feet. That portion of the house which is directly heated contains about 12,374 cubic feet and bears a proportion of 21⅔ cubic feet of space to 1 square inch of area in the heating pipes. The wall surface exposed is about 2012, bearing a proportion of 3 5-10 square feet to 1 square inch, while the equivalent glass surface is 519 square feet and the proportion is 0.905 square foot to 1 square inch in the hot air pipe.

The correct grate area is given as 490 square inches, or about 3.4 square feet; and as there are 52 square feet of heating surface in the furnace the proportion is 1 square foot of grate to 15.3 square feet of heating surface. The

Fig. 4.—Plan of Second Floor.

HEATING AND VENTILATING A RESIDENCE WITH A HOT AIR FURNACE.

be noticed that the pipes leading to the different rooms are generous in proportion to the space heated.

The plan of the first floor of the house is given in Fig. 3, which shows the location of the heating registers and how a ventilating register from each room is connected with the vent shaft. A plan of the second floor is given in Fig. 4, 9-inch round hot air stacks being used for heating the chambers over the library and sitting room and 4 x 12 stacks for heating the bathroom and adjoining chamber. These two rooms not being convenient to the stack, the vent flues run up in the partition and connect with the shaft as previously described. On the plans shown in Figs. 3 and 4 there is given for each room the capacity in cubic feet, the exposed wall surface, the glass surface, the equivalent of the glass surface, calculating that 10 square feet of wall will lose as much heat as 1 square foot of glass, and the ratio of 1 square inch of area in the hot air pipe to the cubic space, the wall surface and the equivaproportion of grate surface is 1 square inch to 25 cubic feet of space, 4.1 square feet of wall surface or 1.06 square feet of equivalent glass surface. The proportion of heating surface in the furnace is 1 square foot to 238 cubic feet of space, 39 square feet of wall surface or 10 square feet of equivalent glass surface.

The coal used is of the soft smokeless variety, and the amount consumed during a winter season is about 12 tons. The house is a well built frame construction, having felt and 1-inch pine sheathing. With the data given here more extensive comparisons can be made by those who desire to do so.

The Warren Steel Range Company of Warren, Ohio, are very busy at the present time filling orders, one of which calls for 500 Ranges. Manager Shook, according to a local paper, says that a continuance of the present demand will require an early enlargement of their manufacturing facilities.

ODD PLATES.

The Novelty Mfg. Company of Jackson, Mich., are distributing a handsome lithographed poster showing their Aluminum No. 3 Heating Stove. The poster is in colors and represents an interoir view, in which a little child in scanty attire stands beside the Stove, surrounded by numerous pets in the shape of dog, cat and kittens. The poster is bound at the top and bottom with metal strips and is provided with a metal loop for hanging it in a conspicuous place in the dealer's establishment.

The Indianapolis Stove Company of Indianapolis, Ind., have finished the work of moving into the buildings recently purchased by them, and are now ready for active operations. We understand that the plant is modern and thoroughly up to date in all particulars and has a capacity of 500 Stoves per week. About 125 men are employed and the outlook for fall and winter business is said to be good.

The title of the Sheffield Stove Works, Sheffield, Ala., has been changed to the Sheffield Stove Foundry.

W. B. Wilkinson, 210 Water street, New York, manager of the Howard Furnace Company's branch, is making an extended trip in New Jersey, Pennsylvania, Delaware and Maryland in the interests of the Howard Hot Air Furnaces.

George M. Clark of George M. Clark & Co., Chicago, Ill., manufacturers of Gas Ranges, was one of the visitors in New York City this week.

The Ringen Stove Company, St. Louis, have been experimenting for some months past with a process to enamel the fronts of their Quick Meal Steel Ranges, instead of painting them, and have finally succeeded in perfecting a process whereby they are enabled to do this. The great difficulty with enameling the fronts of Ranges has been that in riveting the Range the enamel would crack and peel off. By the process now adopted by the Ringen Stove Company the fronts are enameled and the rivets placed in position without any peeling or cracking whatever. The result is a smoother, blacker and glossier front than can be obtained by painting, and also a front that will stand very much greater heat. The rivets used by the Ringen Stove Company in their Quick Meal Range are nickel plated and the effect is very handsome.

The Standard Lighting Company, Cleveland, Ohio, report very large sales of their New Process Oil Heater, advertised in our columns this season.

We have received from the Standard Thermometer & Electric Company of Peabody, Mass., a circular of the Standard Oven Indicator. This is designed for use in the over doors of Stoves and Ranges. The dial is free from any marks which would convey an idea of temperature, it being claimed that when experimenting heat of the right degree for cooking any article of food is learned, and the hand on the indicator shows the mark. When cooking the same food again it is only necessary to get the oven to a temperature that will make the indicator reach the same mark, when it will be perfectly safe to put in the food for baking. By this means overdone or underdone baking is prevented, and instead of the cook rushing things into the oven as soon as they are ready, whether the over is ready or not, the indicator shows whether or not the oven is in a fit condition for use.

The Round Oak Stove Works, Dowagiac, Mich., have just installed one of the largest engines in that section. It is a 400 horse-power cross compound Reynolds-Corliss engine, built by the Edward P. Allis Company, Milwaukee. Steam is generated for it by new Babcock & Wilcox water tube boilers.

W. H. Switzer, president and general manager of the Superior Foundry Company, Little Falls, N. Y., manu facturers of Superior Furnaces, is now making a tour of the West, visiting the company's agencies and establishing a number of new ones. The past week was partly spent in Chicago. Mr. Switzer reports a very good business in progress. He finds a very much better feeling in the country trade and regards the prospects for the future as very encouraging.

William H. Whitehead, late of the Chicago & Erie Stove Company, and an ex-president of the National Association of Stove Manufacturers, was among the callers at our Chicago office last week.

Horton, Gilmore, McWilliams & Co., 172 to 176 Lake street, Chicago, are exhibiting a large line of samples of Cole's Air Tight Heater. No less than 14 sizes of this Heater are now made, and in five styles, comprising an assortment which is certainly designed to cover a very wide range of requirements. The largest sheet iron Stove for wood is 36 x 24 inches and 30 inches high. The largest cast top Stove for wood is 30 x 19 inches and 28 inches high. The largest coal Stove, however, is 24 inches in diameter of jacket and should be seen to be appreciated in the fullness of its girth. The demand for these Stoves has been very heavy this fall. The manufacturers report their sales likely to show an increase of 300 per cent. over those of last year.

Rathbone, Sard & Co. state that their stocks of Stoves have fallen so low and the demand is so good that they have been obliged to start up another foundry at Albany, N. Y. They now have two foundries at work there and one at Aurora, Ill., or three in all, which are turning out work as fast as it is possible for the men to get it in shape. On some patterns of Stoves they have fallen so far behind at Aurora that it is not uncommon for pieces to be mounted on the same day they are cast. The new base burners brought out this year have proved especially popular, but a good demand has been experienced for other Stoves of the Acorn brand.

C. W. Aldrich of Minneapolis, Minn., a traveling representative of the Mississippi Valley Stove Company, Fulton, Ill., has been granted a patent on a Heating Stove. It has a central or combustion chamber and top and bottom radiating chambers, with flues so arranged that the products of combustion first pass downward into the bottom radiator and, after completing the circuit, go upward to the top radiator, and after a passage completely around it pass out into the chimney flue. This course for the heat currents for the fire must lead to a thorough utilization of the heat generated by the fire, and thus economize fuel to a marked extent. Another important feature of Mr. Aldrich's new Heater is found in the fresh air intake. In this Heater there is a supply pipe of air circulating or heating tubes. Some of these tubes open below and above into the room, and certain ones of these are provided with independent means for drawing an air supply either from this intake or from the room We hope the Heater will prove a great success and bring friend Aldrich both fame and shekels.

The line of Gas Heaters and other gas appliances being put on the market by H. Adler, Tr., of 14 and 16 Wood street, Pittsburgh, Pa., are meeting with a heavy demand from the trade, and the volume of business done by Mr. Adler this fall is considerably in excess of any previous similar period. Among the goods for which there has been a particularly heavy demand are the Acme Gas Stoves for natural gas and the Lustre Gas Stoves for artificial or natural gas. These are made in 20 styles and sizes and possess many points of excellence. Mr. Adler is also meeting with a good demand for the Victor Natural Gas Burner, which he manufactures under a patent. A strong point claimed for this Burner is that it is constructed in such a manner that it will not light in the mixer, a feature that is sure to be appreciated by natural gas consumers. Mr. Adler issued some time since a very complete illustrative catalogue of his goods which he will be pleased to send to any address upon application.

A sensational suit, claiming $25,000 damages, has been filed in the Superior Court at Chicago, says the Chicago *Evening Post* for October 12, by A. C. Selleck, a wholesale hardware dealer on West Madison street, against the Northwestern Stove Repair Company, R. L. Greenlee, their president, and R. S. Greenlee, their vice-president and treasurer, T. C. Cunningham, R. Robinson & Sons, J. L. Morris, Michael Brucker, W. S. Cumming and the Manufacturers' Stove Repair Company. All of the defendants are manufacturers or jobbers in Stove Repairs. The plaintiff claims that the defendants formed an association for the purpose of controlling prices, which he refused to enter, and that in consequence he has been forced out of business through his inability to obtain goods.

An interesting series of business conventions began on Monday in New York City under the auspices of the New York Board of Trade and Transportation. The object of these conventions is to promote discussion of important public questions of the time, with the view to benefit general trade. A number of subjects have been selected for presentation by well-known persons, the list of topics including such subjects as " A United States Department of Commerce," " A United States Department of Health," and so forth. The conventions will extend over a period of three weeks, and are expected to be attended by a number of out of town visitors.

A special dispatch from Paris, France, says that the French steamship line, the Compagnie Générale Transatlantique, will shortly construct a new fleet of steam vessels for passenger and freight service between Havre and New York, the average speed of the steamers being not less than 22 knots per hour.

Major Moses P. Handy, special United States Commissioner to the Paris Exposition of 1900, reports that he has secured 25 per cent. additional space for the American exhibit, making the space allotted to the United States equal to that of the other great nations of the world.

THE AMERICAN INSTITUTE FAIR.

The sixty-ninth fair of the American Institute opened at the Madison Square Garden, New York City, on September 20, and will close on November 3. In addition to the exhibits of interest to the trade, the fair has band concerts, flower shows and other special features to attract the sightseer. One feature of this fair is an extensive exhibit of food products. These are arranged around the gallery, while the machinery exhibit is in the basement of the garden, and the main floor is devoted to industrial exhibits.

THE COLUMBIA NOVELTY COMPANY

of 147 Center street, New York, exhibited a specialty which they call the "Two-in-One" salt and pepper shaker. It is made of glass with a metal top with a partition down the center, so arranged that either can be used at will without the other, or both in combination when desired.

THE NEW YORK ROLL WRAPPING PAPER COMPANY

of 440 Pearl street, New York, showed racks for the support, either under a shelf or on a counter, of rolls of paper of various widths for the use of the storekeeper in wrapping up bundles. They also exhibit the Simplex twine holder.

HARMS & KUPFER

of 68 Trinity Place, New York, made an exhibit of the Johnson patented pipe wrench, which is made of high grade material and consists of but two pieces, so arranged that it is adjustable to various sizes of pipe, and is said to do good work without any tendency to crush.

THE J. M. GUNST DISINFECTING COMPANY

of New York displayed in an attractive style cases of their Phenoleum disinfectant, which is designed for use in water closets, urinals or any other place where a disinfectant may be required.

THE BRASS FOUNDRY SUPPLY COMPANY

of 28 Prospect street, Newark, N. J., made a display of their newly patented brass molders' flask, so constructed that the ribs used for strengthening do not interfere with ramming and prevent shifting.

THE DIMOCK & FINK COMPANY

of 220 East 125th street, New York City, exhibited C. H. Moore's patent water closet floor connection, attached to their Apex siphon jet water closet. The device is said to supply a perfect joint in what is generally recognized as the weakest point in the house drainage system—that is, the connection between the earthenware and the drainage pipe. This connection consists of a brass fitting which is imbedded in the earthenware of the closet, and arranged to be screwed directly into another brass fitting, which is soldered tight into the lead bend under the closet.

THE BISSELL CARPET SWEEPER COMPANY

of Grand Rapids, Mich., made an exhibit, in charge of their New York house. at 103 Chambers street, showing the various styles of the Bissell and their Cyco Bearing, Grand and Crown Jewel carpet sweepers.

THE KNIGHT ASBESTOS COMPANY,

Times Building, New York, made an extensive display of their water filtering and cooling fixtures. They showed water drawn direct from the hydrant service in a white enameled bathtub, and the same water in another tub after it had passed through their filtering device, showing a marked difference in the clearance of the water.

THE AMERICAN INCANDESCENT LAMP COMPANY

of 205 East Seventy-sixth street, New York City, had an extensive display of incandescent lamps, globes and fixtures for gas lighting. Their lamp consumes gas through a Bunsen burner, the heat from which is used for heating a fire proof mantel to a white heat, from which the light is secured.

THE NEW JERSEY WIRE CLOTH COMPANY

of Trenton, N. J., made an exhibit of the Roebling standard fire proof wire lathing and the methods of applying it to buildings.

THE A. A. GRIFFING IRON COMPANY

made a fine display of their house heating boilers and various styles of radiators, and also of their steam specialties for various purposes. The Bundy gravity pump and tank trap were shown in operation, using compressed air instead of steam. Steam separators, grease extractors, the Hydrox pot trap and exhaust heads were other features of the exhibit. The company had a complete line of attractive circulars for each of their specialties, showing the construction by broken views and giving explanations of their operation.

THE GORDON-BURNHAM BATTERY COMPANY

of 82 West Broadway, New York, had a display showing the various uses to which the Gordon primary cell can be put in ordinary electrical work. It is pointed out that the cell is absolutely non-freezing and is not consumed by local action when not in service.

THE AMERICAN GAS FURNACE COMPANY,

New York, combined two exhibits in one, one devoted to the American oil gas engine and the other to gas blast furnaces, forges and heating machines for brazing and mechanical purposes, and also fire pots for plumbers and tinners.

THE IRON CLAD MFG. COMPANY

displayed the improved Iron Clad gas water heater, a specially constructed boiler which can be used in connection with the ordinary kitchen range and also heated economically by means of a gas burner, automatically controlled, placed beneath it.

THE THATCHER FURNACE COMPANY

of 240 Water street, New York, showed one of their latest style Thatcher ranges, which is made with either right or left hand oven, for use with either horizontal or vertical boilers and with all modern improvements.

BEHRER & CO.

of 69 Centre street, New York, exhibited the sanitary earthenware manufactured by the Charles Graham Chemical Pottery Company of Brooklyn, N. Y. The roll rim kitchen sink with an earthenware back from which the faucets extended, and supported by substantial legs, attracted much attention.

THE BECKFIELD WATER HEATER COMPANY

of Pittsburgh, Pa., showed their Monarch water heater. This heater is made in various sizes and is designed for supplying all the hot water required either in a residence or an apartment house. It uses gas for fuel, the gas supply being under automatic control. The exhibit was in charge of Charles M. Woolcott, 1298 Broadway, New York.

CHARLES A. BENTZEN

of 240 West Twelfth street, New York, exhibited the A B C washer, a machine designed for domestic laundry work, so arranged that a triple action is secured when in operation, affording motion very similar to hand rubbing.

GEORGE L. CUMMINGS

of 208 West Seventy-first street, New York, showed the Cummings water filter, an apparatus designed for purifying the water used in dwellings, hotels or apartment houses. It is arranged to be attached to the service supply and purify all the water that is used in the building. This system is said to be in use in the Hotel Waldorf, where, it is claimed, 1,000,000 gallons of water are purified in a week.

GEORGE M. CLARK & CO.

of Chicago, Ill., made an exhibit of their Jewel gas stoves, ranges and radiators under the charge of Frank C. Blaisdell, their Eastern agent. They gave out handsome chromo-lithographed cards and a little pamphlet showing their various heating stoves and photogravures of handsome apartments in which they are used for heating.

THE GILBERT & BARKER MFG. COMPANY

of 82 John street, New York, made an exhibit of Clarke's automatic instantaneous water heater. This heater is designed to be connected with the hot water service system of a house either in connection with or independent of the kitchen range boiler. The construction is such that on opening a hot water faucet in any part of the dwelling the flow of water through the service pipe opens the valve connected with the gas supply and the water passes through a coil presenting a large amount of surface in copper pipe, against which the flames play, so that the water is heated as fast as it flows.

TRADE REPORT.

METAL MARKET.

Pig Tin.—A fairly large business has been effected, chiefly in moderate sized lots such as consumers usually require for current use or to keep their stocks in good working shape. Without the aid of speculation here wholesale prices have gradually hardened, and the market at this writing shows decidedly firm tone. Jobbers' prices are firm at 14¾c. per lb. for Straits Pig in small lots from store.

Copper.—There has been somewhat freer offering from several quarters and the market is slightly weaker in tone, without, however, other than very moderate fluctuation in prices. Exports have not been up to the late average and the European demand has moderated somewhat. The market, as a whole, remains in much the same condition as it was a week ago. Small lots of Lake Ingot from stock are quoted at 12¼c. per lb. and Ansonia Grade Casting Copper at 11¼c.

Sheet Copper.—No decided change for the better or for the worse is noted in this department. Sales are of fair proportions and probably fully equal to the average volume for the season. Prices are stiffening and manufacturers are unwilling to book orders for deliveries extending beyond the end of this year. For spot and early delivery the ruling quotation for Sheet Copper in retail lots is at about 15c. per lb., basis.

Pig Lead.—The market has been unsettled and rather weak, owing to some selling pressure here and in the West, together with more or less "bearish" effort of some operators. The consumptive demand is tame, large buyers seemingly having filled their future requirements for some time ahead. In a retail way business was only moderate, and jobbers' prices for small lots were put down about ⅛c. a pound, American Pig ruling at 4½c. to 4⅝c. per lb.

St. Louis advices are as follows: The market has continued to ease off and very little trading is being done.

Lead Pipe and Sheet.—The demand for these materials has shown little spirit. Orders were largely of a hand to mouth cahracter and made up a meager total. No marked increase in the demand is looked for before the spring. On the whole, the season's trade has been disappointing to the manufacturers and dealers, but they look forward hopefully to great improvement after the turn of the year. Eastern dealers quote 6¼c. per lb. for Pipe and 7¼c. per lb. for Sheet, subject to a discount of 20 per cent.

Spelter.—Moderate sales only have been reported here, and the Eastern demand generally is tame, with larger lots than a few carloads seldom involved. Prices are rather weak and the offerings more liberal. Galvanizers and Brass manufacturers seem to bc well supplied for operations ahead in contracts placed last month. Quotations for retail lots are unchanged, 4¾c. per lb. for good Western brands being the outside price asked by jobbers.

St. Louis advices indicate no change in Spelter at that center. The demand is moderately heavy and prices remain unchanged.

Antimony.—The market has been quiet but steady at about 8¼c. to 8½c. for Cookson's, 7¾c. to 8c. for Hallett's and 7¼c. to 7½c. for Japanese.

Nickel.—Prices remain steady at about 38c. per lb. for small lots.

Aluminum.—A reduction of 2 to 3 cents a pound in the price of Aluminum Ingots has been made by the Pittsburgh Reduction Company in their October list. Present prices are as follows: No 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb., 100 lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb., 100 lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb., 100 lb. lots, 30c. Scrap Aluminum is quoted at 30c. per lb., f.o.b. works at New Kensington, Pa.

Tin Plate.—Orders for American Plates have been running light during the week. Selling competition, on the other hand, shows more sign of life, and prices are, if anything, a shade weaker. Deliveries on contracts are still much delayed, however, and spot orders are difficult to place. The scarcity of Steel continues, and mills in many cases are considerably hampered in their operations. A falling off is noted in the demand for Cokes. The canning season is virtually over, and little or nothing in the way of orders comes from that source, while Tinware makers and other users of Bright Plates seem backward in buying. Most of the larger consumers have probably placed their contracts for supplies well ahead, and are taking no interest in the current market. Other buyers are thought to be holding off in the expectation of lower prices. Roofing Plates have been a particularly disappointing article this season. Various reasons are given for the restricted demand for these Plates. Some attribute it to slackness in the building trade. Others to the increasing use of shingles and other coverings in buildings where Terne Plates were formerly used. Whatever the cause, it is certain that a much smaller quantity of Tin roofing has been used this year than formerly. The retail trade has been fairly active. No sign points to any early advance in prices, notwithstanding the advancing tendency in Steel and the comparatively light stock of available Plates at the mills and in second hands. Something of a sensation was caused in the trade this week by the news of several large new Tin Plate plants being likely to be built, which would inflate very materially the capacity of the American industry. It is felt, however, that even if all the projected plans are carried out it will be many moths before they will be able to make any sensible impression on the market. Jobbers' prices show no noteworthy change. Quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins, IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3 40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs., $3.30 to $3.40; American Charcoal Brights, Melyn grade, IC, 14 x 20, $4.55; Allaway grade, IC, 14 x 20, $4.15; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are in light demand, and prices are more or less nominal.

Chicago advices are as follows: This branch of trade is perverse, prices being weak when they should be strong. Ternes are particularly heavy, especially the cheapest grades. The advancing prices of Steel must soon have a bracing effect on this as well as other finished products.

A special London cable dispatch of October 13, 1897, reports on the British Tin Plate market as follows: Tin Plates are weaker, owing to workmen acceding to masters' terms. Business has been chiefly in odd sized oil sizes. Stocks at Swansea, 82,678 boxes. Ordinary Cokes sold at 9s. 6d. at Swansea.

Sheet Iron.—The demand for Black Sheets is referred to as quite active. Mills are somewhat hampered by the difficulty in obtaining supplies of Bars, and both Black and Galvanized Sheets for prompt delivery are hard to obtain. Prices are decidedly firmer since the meeting of Sheet manufacturers in Pittsburgh last week, when an advance was made, which is expected to be sustained So far their action has not affected jobbers' prices in this vicinity, however. These are unchanged from the rates reported for the past few weeks—namely, 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron, 2 65c. to 2.70c. for No. 27 R. G. cleaned and 75 and 10 and 5 per cent. off the list for Galvanized Iron.

Chicago advices are as follows: Prices are maintained by all manufacturers on the basis of the recent advance. Inquiries are being received, but few mills are found able to consider deliveries earlier than five or six weeks. Inquiries are now accompanied by specifications, showing that the material is absolutely needed. Small lots from stock are selling at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—Only a moderate business is reported, with no quotable change in prices. Dealers are paying about the following prices for New York City delivery:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¼c.
Light Brass	per lb. 4¼c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 2¾c.
Zinc	per lb. 2 c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4¼c.
Wrought Scrap Iron, per gross ton	$10.00 to $10.50
Heavy Cast Scrap, per gross ton	$9.00 to 9.50
Stove Plate Scrap, per gross ton	5.50
Burnt Iron, per gross ton	4.50

THE IRON MARKET.

The monthly Pig Iron statistics published by *The Iron Age* furnish eloquent proof of the expansion in the demand for Iron during the past few months. From a weekly product of 165,000 tons on August 1 the capacity at work has risen to 200,000 tons, and yet stocks have declined over 200,000 tons, of which by far the greatest quantity was absorbed during September. It is quite clear, therefore, that consumption lately has expanded even more than production, so that there is nothing alarming in the known fact that additional furnaces are getting ready. As a matter of fact, nearly every well equipped furnace in the territory west of the Alleghany Mountains and north of the Ohio River will be running by November 1. That means that nothing more is to be expected in the way of expansion from that section.

The South is in a position to produce more heavily, so far as furnace equipment is concerned, but it will not be quite so easy to provide the necessary fuel and Ore.

The East, of course, has many plants idle, and a considerable number are in shape to start operations. A good many stacks are carried along in the lists because they have not been actually dismantled. They might as well be in the South Sea Islands so far as their ability to make Iron at a profit is concerned. We do not believe that the real live capacity in the country is much above 225,000 or 230,000 tons a week. We are not likely to reach the necessity for such a total, with the winter before us, and the usual slackening of consumption during that season.

There is, therefore, no occasion for anxiety, but it must be conceded, too, that we have not got any extraordinary amount of reliable reserve.

From the Central West come reports of a continuance of the scarcity of Steel for early delivery, thus confirming the evidence furnished by the reports from the furnaces. The majority of the Steel works are full of orders until well toward the end of the year. This would seem to justify the conclusion that we are not to witness the usual winter scramble for work as early as usual, if, in fact, it does come at all.

The Wire trade maintains unusual activity, if the demand for Wire Rods for early delivery be a criterion of the condition of the business. One firm of merchants have sold about 15,000 tons of Rods during the week.

Prices along the whole line of Rolling Mill products are steady, and advances where made are being well maintained.

Pig Iron.—The New York market has been quiet and steady. It is certain that there is more Iron being melted, but founders generally complain that there has been no upward tendency in their products so far, and that from their point of view there is nothing to justify higher prices for metal. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

Philadelphia advices are as follows: Buyers could be found for almost any quantity of Iron at a little below the asking prices, but sellers are not numerous even at their own figures. Shipments are called for with such urgency that makers feel very different to what they did when requests for postponements were almost of daily occurrence. There is everything in the situation to stimulate confidence and nothing to indicate an overbought market, so that it is no wonder that prices are firm. It would be very difficult to get any kind of Pig Iron at $10.25: not much Plain No. 2 could be had at $10.75, or No. 2 X at $11.25. These are certainly minimum figures; 50c. to 75c. more is very frequently quoted, and if the Iron is not taken at these or pretty near to these figures holders are satisfied to keep their Iron. General quotations for seaboard deliveries are about as follows, with the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.50; No. 2 X Foundry, $11.25 to $11.75; No. 2 Plain, $10.75 to $11.

In the Chicago Pig Iron market, the local producers continue to take the lion's share of the current business. They report an excellent trade in lots running up to 500 tons for general consumers. The demand has been heavier for special grades. The Southern sales agents report a satisfactory week, the leading companies having their outputs so well sold that they are not in a position to take much business for delivery the remainder of this year. It is expected that freight rates from the South may be advanced in the near future and that prices are therefore at present as low as can be made for a long time to come. Not much is doing in Lake Superior Charcoal. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to	$13.00
Local Coke Foundry, No. 1	11.50 to	12.00
Local Coke Foundry, No. 2	11.00 to	11.50
Local Coke Foundry, No. 3	10.50 to	10.75
Local Scotch, No. 1	11.50 to	12.25
Ohio Strong Softeners, No. 1	12.00 to	12.25
Southern Silvery	11.25 to	11.50
Southern Coke, No. 1	11.00 to	11.25
Southern Coke, No. 2	10.60 to	11.00
Southern Coke, No. 3	10.35 to	10.60
Southern, No. 1 Soft	11.00 to	11.25
Southern, No. 2 Soft	10.60 to	11.00

Prices on Bessemer Pig in the Pittsburgh district are firmer. Foundry Irons are quiet. We quote as follows, f.o.b. cars Pittsburgh district: No. 1 Foundry, $10.50 to $10.75; No. 2 Foundry, $10 to $10.25; No. 3, $9.50 to $9.75; Bessemer, $10.50 to $10.65.

The general condition of the Pig Iron trade in the Cincinnati district is one which is causing a feeling of very great satisfaction. The tonnage of new orders booked during the past week has been moderate and made up mainly of lots ranging downward from 500 tons, with but few placed for the maximum amount. Deliveries would be all that could possibly be asked for by the most exacting factor were it not for a continuance of the car famine in Southern railroad circles. Purchasers are anticipating their contracts in taking Iron, and this leads to the belief that many who were considered out of the market for from four to six months yet to come will again appear as buyers considerably before the expiration of that time. Perhaps most of the Southern furnace interests are now getting outside quotations on the majority of their grades, but Iron can still be bought at the inside figures from several furnaces which have not well filled order books. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to	.....
Southern Coke, No. 2	9.50 to	$9.75
Southern Coke, No. 3	9.00 to	9.50
Southern Coke, No. 1 Soft	9.75 to	10.00
Southern Coke, No. 2 Soft	9.50 to	9.75
Southern Coke, Gray Forge	9.00 to	9.25
Southern Coke, Mottled	9.00 to	.....
Ohio Silvery, No. 1	12.75 to	13.00
Ohio Silvery, No. 2	12.00 to	12.25
Lake Superior Coke, No. 1	11.00 to	11.50
Lake Superior Coke, No. 2	10.50 to	11.00
Tennessee Charcoal, No. 1	13.00 to	13.25
Tennessee Charcoal, No. 2	11.50 to	12.00

The St. Louis market shows no particular change. There continues to be a scarcity of No. 2 Foundry and No. 2 Soft, and full prices are readily obtainable for these grades. The consumption of Pig Iron is very heavy and sales indicate that a continuance of the present activity among manufacturers is confidently anticipated. Consumers are in the market for delivery during the early part of next year, but sellers ask higher prices for such deliveries than consumers are at present willing to name. Some difficulty is experienced in having specifications filled promptly, as furnaces have pretty much all they can handle. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.75 to	$11.00
Southern, No. 2 Foundry	10.25 to	10.50
Southern, No. 3 Foundry	9.75 to	10.00
No. 1 Soft	10.75 to	11.00
No. 2 Soft	10.25 to	10.50

CHICAGO REPORT.

Scrap.—Old material is being sold as fast as it can be obtained from sources of supply. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$8.50	....
Machinery Cast	7.00	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	4.50	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c.	2.50	....
Old Boilers—whole (Iron)	3.00	....
Old Boilers (Iron)—cut in single Sheets and Rings	5.00	....
Old Gas Pipe and Boiler Tubes	5 00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	9 00	....
Copper Wire and Heavy	....	10 c.
Copper Bottoms	....	9 c.
Copper Clips	....	9¾c.
Red Brass	....	8 c.
Yellow Brass	....	7 c.
Light Brass	....	4¼c.
Pipe Lead	....	3¾c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	½c.

Anthracite.—Business is dull. The price on carload lots of 12 tons minimum is now as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill.	$5.35	$5.60
Milwaukee, Wis.	5.35	5.60
Kansas City, Mo.	7.35	7 60
Council Bluffs, Iowa	7.35	7 60
Lincoln, Neb.	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak.	8.60	8.85

Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

THE HARDWARE TRADE.

Trade is moving along in good volume with orders coming largely from the retail trade. In this business the jobbers are getting their full share. There is also a good and pretty steady demand upon the manufacturers, coming from jobbers who need to replenish their stocks or from the larger retailers who buy in sufficient quantities to justify direct dealings with the producers of goods. The tone of the market continues good. The advances which have been made in heavy goods are generally firmly maintained, and there are indications that in other lines manufacturers are watching the situation closely with a view to announcing advances in their goods in case circumstances are favorable. It is recognized, however, that it is unwise to make advances that it may not be feasible to maintain, and manufacturers are disposed to move conservatively in this regard. Reports concerning the business situation throughout the country are decidedly encouraging, and the trade anticipate much better conditions than have prevailed for several years.

Advices from Chicago.—Shelf Hardware jobbers report a good volume of business all this month, notwithstanding the prevalence of the drought, which was so happily broken by the general rains early this week. They felt the influence of the dry weather in some sections in some classes of goods, but present a very cheerful view of the situation by stating that the demand would simply have been much heavier if the country had had its usual rainfall. The condition of the Hardware trade is therefore described as being very much better than would have been expected for the conditions prevailing. The demand, in fact, began to show indications of increasing last week before the rain came. The outlook is now in favor of very much better trade, especially in view of the fact that colder weather is setting in in the Northwest and is expected to extend to other parts of the country. Indications point to quite an advance in Screws, Strap and T Hinges, Bright Wire Goods, &c., owing to the much higher prices now prevailing on the raw materials from which they are made. Very low prices have prevailed for a long time, but the period of exceeding cheapness is now fast coming to an end.

Advices from St. Louis.—The Hardware jobbing trade are feeling much encouraged as the result of liberal rains to which the West and Central West have been treated during the past few days. The situation in many parts of this section was rapidly becoming alarming, and if the rain had been much longer delayed serious results would surely have ensued. The large manufacturers of Screen Door Hinges have disposed of their entire output, and an advance of at least 50 per cent. has been made over the prices ruling on these goods last year. The demand for Tire Bolts and Stove Bolts is very heavy, and the better grades of Builders' Hardware are selling very freely. The demand for Lamp Goods is phenomenal, and the same can be said of Boys' Iron Wagons and Sleds. The continued summer weather has curtailed the demand for cold weather goods to some extent, and the spread of yellow fever in the South has practically shut off the demand for all kinds of Hardware from the infected districts. A number of Texas points are quarantined and other points are in danger of similar treatment. Taking everything into consideration, however, the situation is fairly satisfactory. Collections are in excellent shape.

NOTES ON PRICES.

Wire Nails.—The condition of the market so far as Wire Nails are concerned is substantially the same as at our last review. There continues to be a steady demand on the manufacturers, and it appears to absorb promptly their output, most of the mills, in fact, being behind their orders. The trade are not, however, purchasing in a speculative way and the orders which are being placed are for the most part for lots of medium size. New York quotations are about $1.70 for small lots from store.

Advices from Chicago.—It will be surprising if a sharp advance does not shortly take place in Wire Nails and other Wire products, on account of the scarcity now prevailing in Wire Rods. The largest Wire Nail manufacturers report their facilities crowded to the utmost to meet the demand for Nails. They are almost without exception only quoting for delivery during the month and will not sell for the future, because they cannot tell what the cost of Rods may be. Prices therefore are firm at $1 60 to $1.65 for small lots from stock.

Advices from St. Louis.—The demand for Wire Nails is only fair. Manufacturers are not anxious to sell for delivery beyond the present month. Jobbers report a fair trade at $1.65 base.

Sheet Aluminum.—A radical reduction in the price of Plate and Sheet Aluminum is announced by the Pittsburgh Reduction Company, Pittsburgh, Pa., in their October price-list, just published. A rearrangement of the gauges is also made in the new list, which is as follows :

Plate and Sheet Price List.—B. & S. Gauge.

Prices are for 50 pounds or more at a time. Less quantities, 5 cents per pound additional. Charges made for boxing.

	In coils.	6-in.*	14-in.	16-in.	18-in.	20-in.	24-in.	30-in.	36-in.	41-in.	46-in.	51-in.	56-in.	Polishing one side.	Satin finish without lacquer. One side.

* All columns except the first are for Flat Rolled Sheets.

Discounts as follows are given for orders over 200 pounds :

200 to 1,000 pounds..... 10 per cent. off list
1,000 to 2,000 pounds, ordered in one month..10 and 2 per cent. off list
2,000 to 4,000 pounds, ordered in one month..10 and 3 per cent. off list
4,000 pounds and over, ordered in one month..10 and 5 per cent. off list

Sheets polished or satin finished on both sides, double the price for one side.

Cutting to lengths.—Up to 20 gauge, 1 cent per pound.
From 21 to 30 gauge, 2 cents per pound.

Cut Nails.—There continues to be a fair movement in Cut Nails and the market, both East and West, is in much better condition than a few months ago. The New York price is $1.53 in less than carload lots.

Advices from Chicago.—Stocks in Cut Nails are small, only two houses in this city now carrying anything like an assortment. The other jobbers carry no stock, but draw on these when they have an occasional order. Prices of small lots are somewhat uncertain under the circumstances, but usually range a little under Wire Nails, or $1.55 to $1.60.

Advices from St. Louis.—The market for Cut Nails is in good shape, and mills report steady sales. Jobbers quote $1.45 base for small lots from store.

Barb Wire.—The Barb Wire market has a firm tone and the demand is fair. Quotations continue unchanged.

Advices from Chicago.—The Rod situation, as given under the head of Wire Nails, applies with equal force to Barb Wire. The movement from factories grows heavier from week to week and buyers are now pushing for more prompt deliveries on contracts. The outlook is decidedly in favor of higher prices, but for the present quotations are maintained at $1.60 to $1.65 for Painted, and $1.90 to $1.95 for Galvanized, in small lots from stock.

Advices from St. Louis.—There is no change to note in this department. The demand is only fair. Jobbers ask $1.65 for small lots of Painted from store, with the usual advance for Galvanized.

Smooth Wire.—There have been no special developments in the market during the past week. There continues to be a steady demand, and Smooth Wire is apparently taking a more prominent place in the market than heretofore.

Poultry Netting.—There is no very important change to report in the market for Poultry Netting, and the indications are that the prices for next season will not be materially different from those which prevailed during the past season. It is understood that some of the manufacturers will put on the market a line of competition Poultry Netting, which will be in some respects different from the standard and will command a slightly lower price.

Glass.—The Glass manufacturers have been holding preliminary meetings at Columbus, Ohio, during the past week, the object of which has been the reorganization of the Glass associations and the formation of an American Glass Company. It is understood that the plans will probably be successfully carried out. As it is so late in the year and stocks in manufacturers' hands are much depleted, it is probable that whether or not the American Glass Company, or a single association of some form, are the outcome of the negotiations, some action will be taken by the manufacturers to arrange for the starting of the Glass factories in the near future. The new price-list of French Glass, which went into effect on October 1, is subject to a discount of 80 and 20 per cent., instead of 85 per cent. as stated in our issue of last week. The new list is not, however, used by all New York jobbers. The local market is weak, caused by light demand, and while the agreed price at which American Glass is to be sold is 60 and 10 and 5 per cent. discount, orders have been accepted as low as 60 and 20 per cent. discount.

White Lead.—There is no new feature in the market. Buyers have purchased in the ordinary way, taking about what they usually do at this season of the year, while sellers generally were accommodating in filling orders at old prices. Nothing in the way of distinctly new feature has come to the surface. Both Pig Lead and Linseed Oil have ruled rather weak, but not enough so to cause any break in either Dry or Oil Leads for spot or future delivery.

Red Lead.—Both domestic and foreign product have remained very steady in price, but nothing more than ordinary business has been effected in either, and buyers are at present operating in very ordinary way.

Linseed Oil.—The market has been more settled and may fairly be quoted steady, at prices within the line of 34 to 35 cents for city brands of raw and 33 cents for Western. This slight improvement is attributed chiefly to steadier market for raw material, there having been merely ordinary business in the products.

Spirits Turpentine.—Prices have moved steadily upward under the influence of moderate offering here and strong advices from the South. Up to 34½ to 35 cents has been paid for good sized lots.

The plant of the St. Louis Smelting & Refining Company, St. Louis, Mo., is about to be put in operation again after four years of idleness. Missouri lead ores will be treated.

It is rumored that the Pittsburgh Reduction Company are about to close their branch office in New York City and transfer their Eastern selling agency to a local jobbing house.

Official figures show that the production of gold in Australia during the first six months of 1897 was 1,050,644 ounces, an increase of 183,022 ounces as compared with the output for the corresponding period of 1896. Increases took place in Westralia and Queensland; New South Wales remained practically stationary, and Victoria showed a cousiderable falling off.

A dispatch from Berne, Switzerland, reports that the Swiss National Council have adopted a bill for the purchase of the five principal railways of Switzerland at a cost approaching $200,000,000 aud have authorized a loan for the purpose. According to the latest official returns, there were 2304 miles of railway open for traffic in Switzerland ou January 1, 1896.

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. Terms and Definitions—15 Pages,
II. Drawing Instruments and Materials—13 Pages,
III. Linear Drawing—6 Pages,
IV. Geometrical Problems—35 Pages,
V. PRINCIPLES OF PATTERN CUTTING—25 Pages,
VI. PATTERN PROBLEMS (3 Sections)—325 Pages.
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

—A SHORT CUT.—"Mr. Priggs is a very ordinary sort of man," remarked the candid observer.

"Undoubtedly," replied Senator Sorghum.

"While Mr. Diggs is exceptionally brainy."

"I believe so."

"And yet Priggs has succeeded and Diggs has failed. How do you account for it?"

"Easily enough," replied Senator Sorghum. "Diggs put in his time trying to learn more than other people, while Priggs devoted himself to convincing them that he already knew it."—*Washington Star.*

—BUSINESS IN THE BLUE GRASS REGION.—The blue-grass colonel relates an incident which well illustrates the shrewdness of the Kentucky grangers in business affairs. It appears that a farmer lost a calf, and a neighbor pastured it until the bill amounted to about the value of the animal. The owner found out one day where his missing calf was and went after it.

"How about the bill for this?" he inquired.

"Well, I've been thinking about that," was the reply, "and I've concluded that if you'll let me have the calf I'll call the matter square."

The old man thought over the situation for a while. Then he said: "Bill, the calf is really worth more than your claim, but I'll tell you what'll I do; if you will pasture the calf for four weeks more for nothing, you may have it."—*Chicago Times-Herald.*

—NOT AN INAPPROPRIATE NAME.—"I presume," said the talkative man to his seat mate in the railway train, "from your manner and conversation that you have family ties."

"Yes," replied Mr. Meekton; "I s'pose you might as well call 'em that. I buy 'em for myself, but my wife and the girls all wear 'em whenever they feel like it."—*Washington Star.*

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

—AND SO THEY WERE MARRIED.—Years ago there lived in a Massachusetts town a justice of the peace known as "Square" Simmonds, a man noted for the shortness of his memory. He carried about with him a slip of paper on which was written the brief marriage form which he used when called upon to unite a pair in the bonds of matrimony. He never trusted himself to begin the ceremony without reference to this document.

One day, at a county fair in a neighboring town, he was approached by an elderly couple, who expressed their wish to be married then and there. After some conversation the "Square" agreed to perform the ceremony on the spot; and the three, accompanied by a grown-up daughter of the man and a sister of the prospective bride, stepped into a convenient horseshed.

There the "Square" began a fruitless search for the important paper, growing more and more perturbed as each succeeding pocket played him false. At last he abandoned the search.

"Are you willing to marry this woman?" he asked the man, who replied with a prompt "Yes."

"And you want to marry him?" asked the Justice, turning to the bride.

"I do," said she, with promptness equal to the bridegroom's.

"Then," said the "Square," in his most impressive tone, "I hereby pronounce you married, according to the memorandum left at home in my other trousers' pocket.—*Youth's Companion.*

—"THE London Mail" says that a number of wealthy Englishmen have organized an expedition to come to the United States to shoot wild horses in the Rocky Mountains. The gentlemen can, after they get through shooting "wild horses in the Rocky Mountains," come down to the plains and shoot the ooglywoo, which is found in great numbers in that vicinity. It has six legs and a very strong, short tail. When danger appears it at once stands on its tail and spins rapidly around. Of course, this makes a hole, into which the ooglywoo sinks rapidly out of sight. The hole then disappears also.—*Forest and Stream.*

—IT IS NOT every great man who carries his honors as meekly as the Mayor of Inverness, who rebuked an admiring crowd in the words: "Fr'ens, I'm just a mortal man like yersels." Sir Wilfrid Lawson tells the following story: "A woman was once pursuing her fugitive cow down a lane, when she called out to some one in front: 'Man, turn my cow.' The man took no notice and allowed the cow to pass. When she came up she said: 'Man, why did you not turn my cow?' He replied: 'Woman, I am not a man; I am a magistrate.'"—*Household Words.*

THE REAGAN

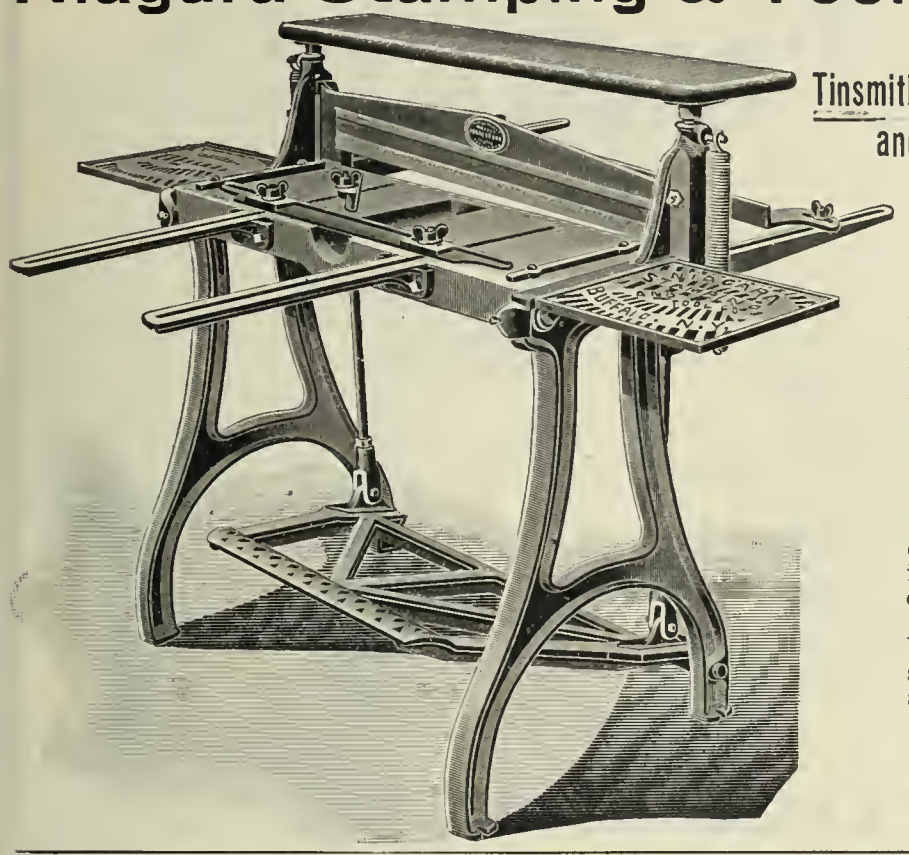
Metallic Shingle

The Strongest, Lightest and Most Economical. Reason: The style of pattern makes it strong. Its weight is the lightest and its first cost, together with the rapidity with which it can be put on, makes it the most economical.

The Cincinnati Stamping Co.,

Cincinnati, Ohio.

Niagara Stamping & Tool Co., Buffalo, N.Y.



MANUFACTURERS OF

Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.

EXCELSIOR SQUARING SHEARS.

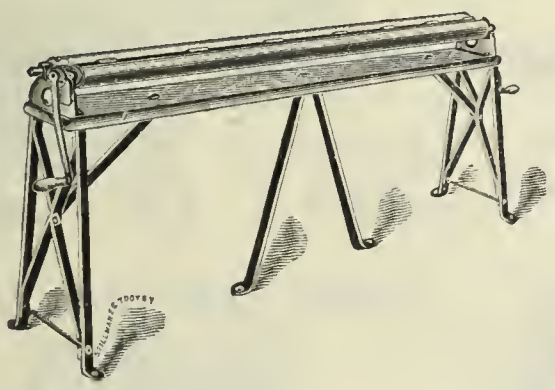
These Shears are accurate and durable. The side legs and guides for the upper knife are cast in one piece, thus securing rigid bearings for the cross head, which has wide scraped bearings and gibs with set screws to take up wear. The bed is marked with a graduated scale in $\frac{1}{16}$ inches, and a wrench to take out and replace the knives is sent with each machine.

Adjustment is provided for wear of the knives. The knives are ground on automatic machines—not on a grindstone—which make them absolutely true in cutting edge and seat, assuring a perfect fit to cross head and bed without backing.

The price of the shears includes a full set of front, back, bevel and side gauges—for cutting at any desired angle without the necessity of marking the sheet—also the top shelf.

For Foot and Power Shears of all Sizes
Refer to Catalogue.

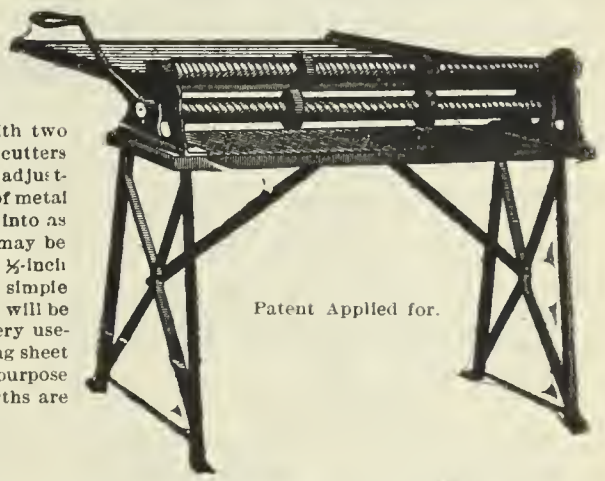
The CAPITAL GUTTER FORMER



is adapted to form gutter from 3 inches to 7 inches inclusive. The forming of the bead and gutter is practically a continuous operation. Capacity 600 feet perfectly formed gutter per hour with two ordinary men or boys.

The Rotary Slitting Shears

are provided with two or more pair of cutters which are easily adjusted to cut a sheet of metal 30 inches wide into as many strips as may be desired, from ½-inch and wider; is simple and durable, and will be found to be a very useful tool for slitting sheet metal for any purpose where long lengths are required.



Patent Applied for.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

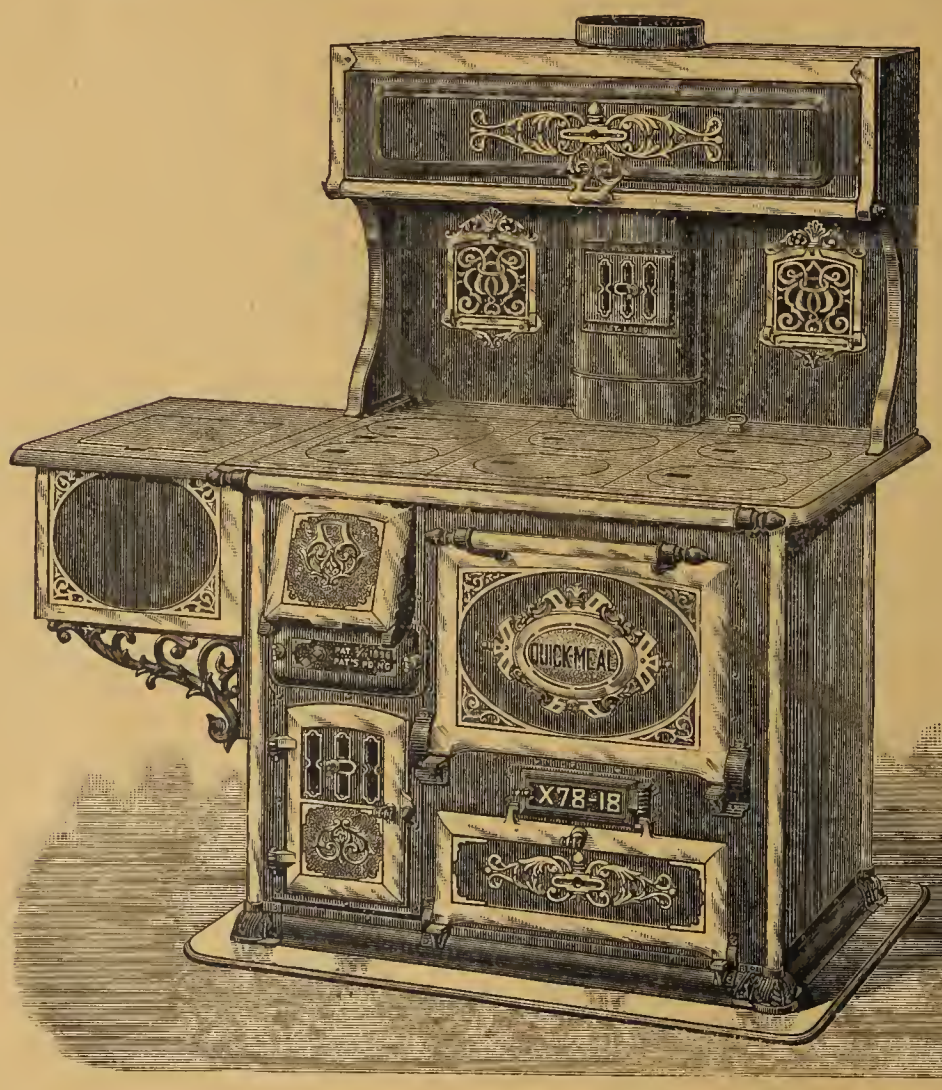
QUICK MEAL

STEEL RANGE.



There are no Steel Ranges made that equal the "Quick Meal."

Not because we are smarter and bigger than others in the business, but because "Our Standard is Higher," and all our energies and efforts are bent towards reaching it.

The "Quick Meals" for 1897 are far ahead of our last season's Ranges, yet you know how good they were then—how superior and how popular!

They are now so much improved, and so fully meet every requirement of a Steel Range, that they have won constantly increasing sales. Even the most exacting pronounce them the "Recognized Standard of Excellence."

"That's What They Are."

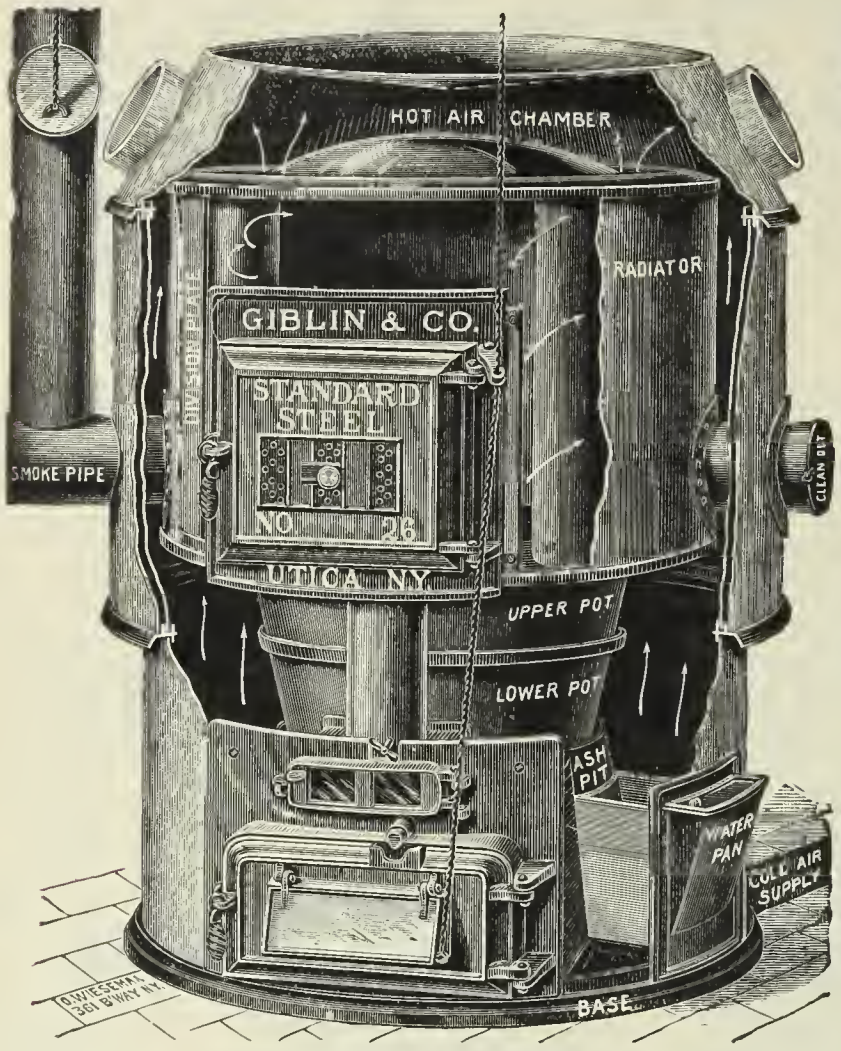
CARTON FURNACE CO.,

Makers of Heating Apparatus for the past *50 Years,*

UTICA, N. Y.

High Grade Heaters.



Nothing Has Been Spared

to make this a perfect heater, and the universal demand for them has shown they have merits which are thoroughly appreciated by the trade.

SOME DEALERS

believe that the quicker a furnace gives out the more business they will have to do, but such dealers

MUST NOT BUY

these furnaces. These furnaces are made to heat and to last and there are many thousands of them in use that have been in constant use for the past ten years and

NOT ONE CENT

expended on them for repairs. There are furnace buyers who appreciate a heater of this kind and know that they can afford to pay more for it than for one that will

NEED REPLENISHING

every other year. We claim for this furnace

durability; available for hard coal or wood; quick response to action of drafts; enlarged radiating surface; indirect draft, and consequent economy of fuel and ease of management. The

DEALERS WHO BUY

these furnaces are a multitude; the others can increase their business and add to their information by finding out what our **CATALOGUE** and **QUOTATIONS** will give them.

We can make prompt shipment at reasonable prices

THE FORBES WARM AIR FURNACE.

PHILADELPHIA, April 10, 1897.

Messrs. TUBULAR HEATING AND VENTILATING CO., 228 Quarry Street, Philadelphia.

GENTLEMEN:—The Forbes Warm-air Furnace placed in my house last fall has given me entire satisfaction.

During the greater part of the winter the house had to be kept at a very high temperature, owing to illness in the family. Your furnace did all it was called upon to do, and on a remarkably small amount of coal.

Last winter a furnace of a popular make failed to even warm the house comfortably, and burned fully 50% more coal.

I think your furnace is all you claim for it, and do not hesitate to recommend it to any one desiring comfort and economy. Very truly,

5027 Florence Avenue. M. J. FALLS.

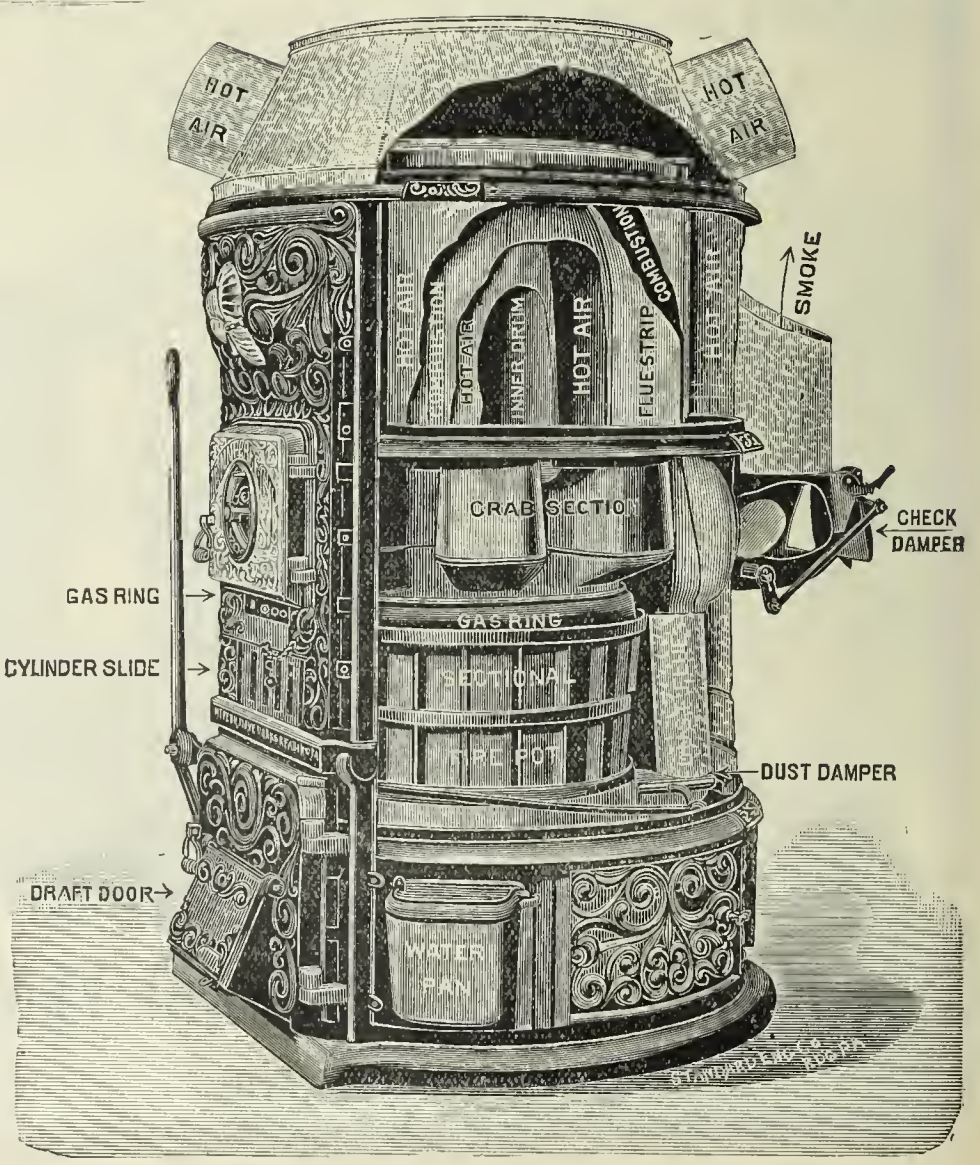
Philadelphia Store, 111-113 N. 2d St.



The Only Round Oak!

Superior to any Heating Stove in the World!

And it has no—"Ash Pan."

For 20 years the eminent Stove Makers have endeavored to account for its phenomenal success—without an—"ASH PAN."

For 20 years they have fought it—"tooth and nail"—"fair and foul"—"it could not succeed," "it had no ash pan."

It is succeeding fairly well—thank you—its sales are nearly—one-third—the entire output of—Oaks—and growing.

It still leads the way—without an "ash pan" and provides—fame—and a—name—for—counterfeits—to trade upon—safely inside the law.

***GREAT* is the only—Round Oak!**

Originated and made famous by

Beckwith,
Dowagiac.

Peerless Andes.

Entirely New. *Finest Range Ever Made.*

WE present the latest addition to the ANDES line of Stoves and Ranges. As will be noticed from the above cut, the design is bold, up to date, and strictly correct, artistically considered. This range is unusually large in every way. It has every improvement which is at all desirable. The oven is very large and well ventilated; heated on five sides The ash pan is unusually large. The fire box is a new and improved form, perfect in its fittings. The grate is of our own improved style of draw out form, together with our own patent arrangement for taking out the single bars without removing the fire box. The entire grate can be drawn out without removing the fire box. The wood fixtures for this range we claim to be better than any heretofore made. The reservoir is unusually large. The oven door, as is shown in the above cut, has the best form of oven thermometer made. The top oven plate is cemented. The bottom of the stove is double. The back of the oven is double. An elegant nickel band on the edge of main top, and also on the edge of high shelf. Reed's patent check damper. Towel rod. Elegant plate panels. In every respect this range is as good in design, form, weight, quality of castings and mounting as can possibly be made. The prices will be right.

The Radiant Andes.

Entirely New. Medium Price.

ELEGANT Plated Trimmings, Handsome, Attractive, Large Sizes, Large Pan, Heavy Pots, Heavy Stoves, Well Made, Durable Stove, Good Hot Air Flue. Every Stove a Double Heater, Duplex or Draw Centre Grate.

Two sizes, No. 13, 13-inch Fire Pot.
" 15, 15 " " "

An important addition to the Andes Line, a handsome, attractive, well made stove, very heavy pots, durable in all parts; it is made to suit the times. Prices are right and will interest the buyer.

Oak Andes.

EVERY manufacturer claims he has the *BEST OAK STOVE.* Every buyer wants the *BEST OAK STOVE,* and without the least fear of contradiction we offer to the trade the

OAK ANDES as the best BEST OAK STOVE.

It has the *BEST AIR TIGHT JOINTLESS BOTTOM,* the *BEST AIR TIGHT REGISTER DAMPER,* the *HEAVIEST FIRE POT,* the *HANDSOMEST DESIGN* and the *BEST WORKMANSHIP* of any stove on the market.

It is beyond question an *AIR TIGHT STOVE.*

The sales for 1896 were four times as large as the manufacturers expected and the indications are now that the capacity of the works will be severely taxed to meet the demand for the present year. Buyers who wish the best should secure agency at once.

We present a fac-simile of the cover to our ***161-page*** Catalogue, every page of which is teeming with interest ***for you.***

The ***immense*** variety of ***Stoves, Ranges, Fire Place Heaters, Furnaces, Laundry Stoves, Gas and Oil Appliances,*** is too great for special mention here.

Won't you become acquainted with its contents by sending for a copy?

THE UNION STOVE WORKS,

70 Beekman and 66 & 68 Gold Sts., New York City.

Does it pay

To sell some old moss-covered pattern just because you have sold it for a number of years? It may have been very popular in its day, but if not kept up to date you cannot afford to give it space in your showroom.

Does it pay to try to sell a line of stoves and ranges that does not give you variety? We think you will admit *it does not pay*, especially when you can buy a line of stoves and ranges that will give you the variety you need, and special patterns exactly suited to your wants at that. This line is the

ACORN

and it is the only line made that will give you variety, bright new patterns, and low prices; prices that cannot be duplicated by anything approaching in excellence the magnificent goods we have to offer. We can easily demonstrate to you that you are losing money by not selling *Acorns* if you will give us the opportunity.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF
Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.
Price, $1.00.

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Have long down indirect draft, always assuring cool smoke pipe and thus economizing fuel.

CORTLAND, N. Y., Aug. 16, 1897.

L. R. LEWIS,

Dear Sir:--I would say regarding the "Kelsey Furnace," that I have used one in my home and also in the First National Bank for seven years and consider them the most durable furnace on the market. There has never been one cent spent in repairs on either of them. And the sections forming the firepot are in as perfect condition now as when new. As to economy of fuel they are unequaled, having thoroughly heated the buildings they are in at a great saving of fuel over the furnaces they replaced. I never fail to advise my friends to purchase a "Kelsey" by all means.

Yours truly,

EDWARD KEATOR, President First National Bank.

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workman."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depend for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with many illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

WOOD FURNACES

THE MONITOR.

ESTABLISHED 1839. INCORPORATED 1894.

OUR IMPROVED MONITOR.

With DIRECT and INDIRECT DRAFT, is made in two sizes for Brick or Galvanized Cases.

No. 38 burns 3 ft. wood, No. 50 burns 4 ft. wood.

The fire-box is made of cast iron, **corrugated** very **heavy** and **substantial.** The dome and radiator are made of **heavy plate** iron (gas tight).

This furnace can be set in low cellars and is easily put into old brick work. With smoke pipe removed, radiator can be cleaned thoroughly in five minutes, by means of clean-out door in front.

Simple to manage and most economical in fuel, with an immense heating power.

We also make the **CLIMAX and HOT BLAST WOOD FURNACES,** the best of their kinds at a lower price. Thousands in use in all sections of the country.

Testimonials and full particulars sent on application to the manufacturers.

STEAM AND HOT WATER FITTERS' TEXT BOOK.

Prepared for the Steam and Hot Water Heating Course at the New York Trade School, with Supplementary Chapters on House Heating, Specifications and Surface Estimating.

BY

THOS. E. McNEILL.

140 Pages, numerous Illustrations and Diagrams, 5 x 7 in., Cloth, $1.00.

This manual, comprising nearly 200 questions and answers, and other matter, is intended as a Pocket Companion for the Steam and Hot Water Fitter and the Apprentice. The contents are purely practical and the questions or problems set forth are answered in a simple and direct manner.

It begins with first principles and progresses in so thorough a manner that many of the seeming mysteries of steam and hot water fitting can be readily understood.

The various systems of steam and hot water heating are explained, as well as the various appliances and apparatus used with them, and the manner of connecting them is described.

The book supplies in simple form information that is much needed by the trade on determining the size of pipes for flow and return, the amount of radiation, the size of indirect stacks, how to make an estimate of the materials for a job without error, and how to make out a specification and contract.

Plans of various systems are given and a full account of all the details of a successful heating job.

CONTENTS.

Chap 1. Tools, Fittings and Pipe.
" 2. General Questions on Heating.
" 3. Low Pressure Steam.
" 4. Two-Pipe Steam Heating.
" 5. Single Pipe Low Pressure Steam Heating.
" 6. Indirect Steam Heating.
" 7. Hot Water Heating.
" 8. Single Pipe Main System.
" 9. High Pressure Steam Heating.
" 10. High and Low Pressure Steam Heating and Power Plant
" 11. Exhaust Steam Heating.
" 12. Power Fan or Blower System of Heating and Ventilating.
" 13. Design. Estimate. Specification.
" 14. Dwelling House Heating.
" 15. A Successful Heating Job.

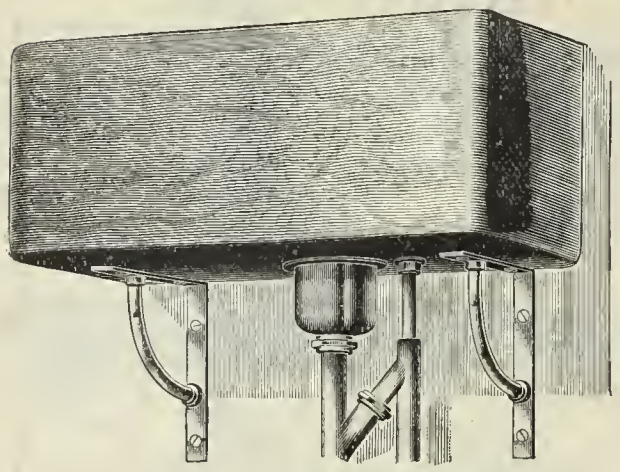
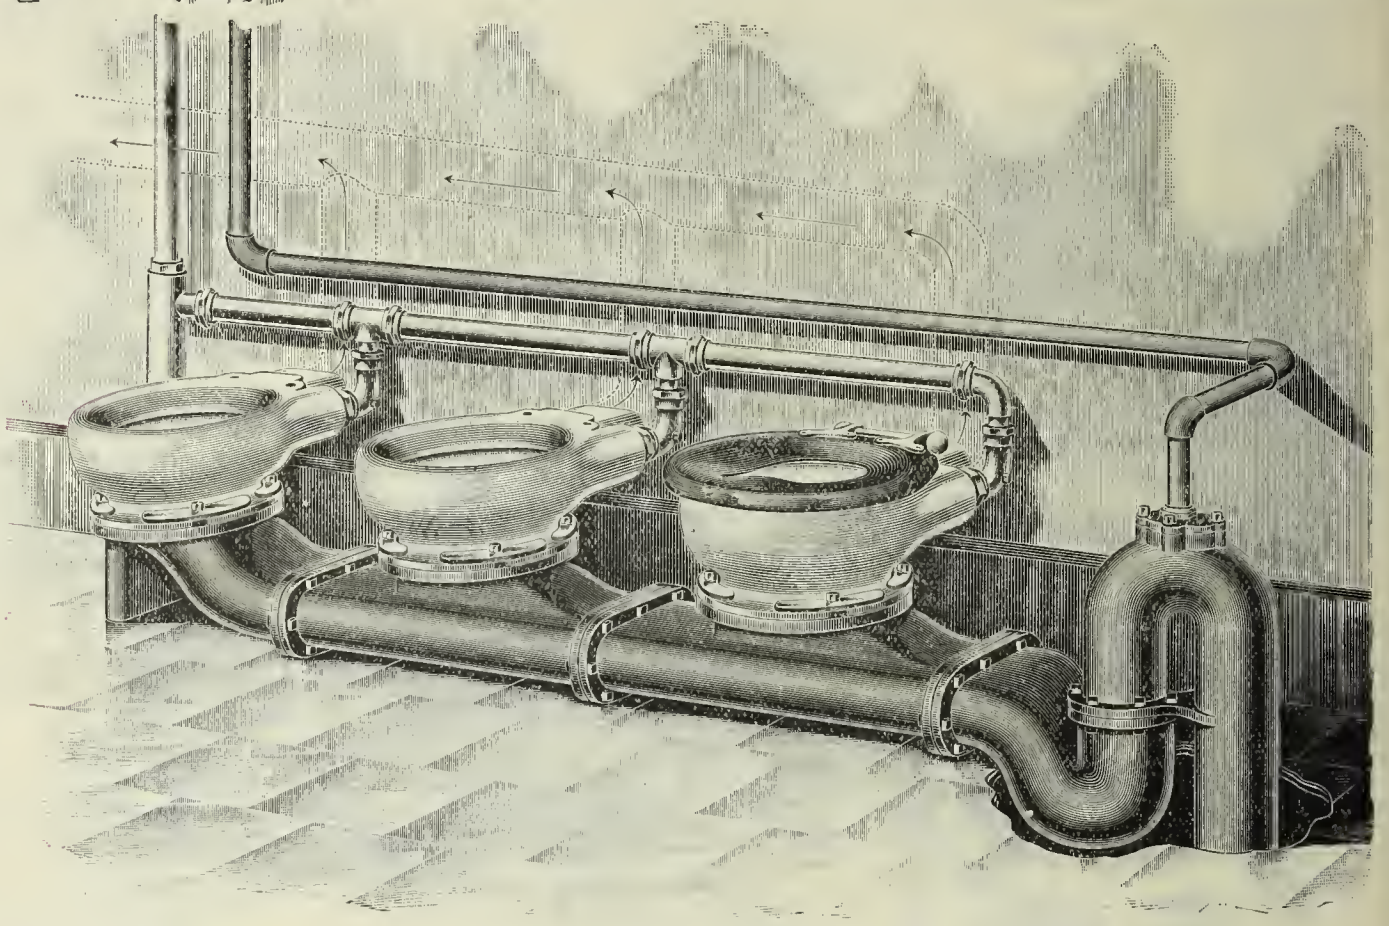
The Sanitas Closet Range.



This range combines all the essential features of the Sanitas Ventilating Closet, with a range or series of seats operated automatically from one tank.

ANY NUMBER OF SEATS FURNISHED FROM 3 TO 10.

In this fixture there are no dry or unwashed surfaces, the flush being through the rim of each bowl and at the end of the range, thoroughly washing every part of the apparatus at each discharge of the tank. Another and important feature is the large local or seat vent, and this, with the large area and depth of water in each bowl, which submerges and deodorizes the soil, makes it a perfect ventilator for the toilet room, and free from all odors. The tank is made of wood very strongly put together, and lined with heavy tinned copper The automatic discharge is very simple and will not get out of order. It works noiselessly at any interval desired, and under all conditions of water supply.



Send for Catalogue showing full line of Sanitas goods.

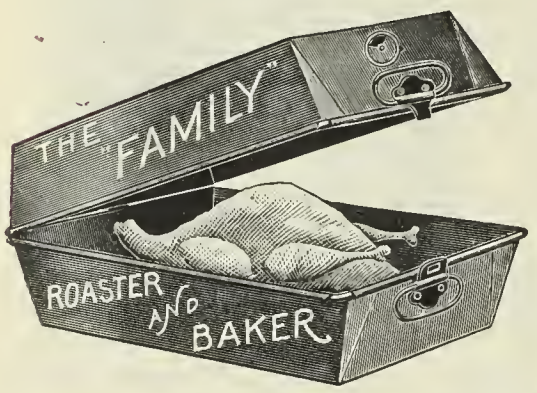
"Family" Roaster and Baker . . .

Made from Black Smooth Steel.



Nos.	10	20	30
Inches	8½ x 12½	10½ x 15½	12½ x 17½

The "Family" Roaster and Baker is a well made double roasting pan, the upper part of which is ventilated.

The two parts are joined by a hook hinge, and when closed are held securely together by this hinge in the back and a tongue in front, which slips through a slotted clip that is riveted to the lower part.

Include a sample lot in your next shipment.

Art of Coppersmithing.

A Practical Treatise on Working Sheet Copper in all Forms.

By JOHN FULLER, Sr.

327 Pages, 474 Illustrations, 7 x 10 Inches, Cloth. Price, $3.00.

This work, prepared at great labor and expense, is reproduced from *The Metal Worker,* and forms an exhaustive treatise on the Coppersmiths' Art, being the only volume on that subject that has bee n published. It is beautifully illustrated with 474 pen and ink drawings, and is bound and printed in the best manner.

CONTENTS:

Historical Sketch of Copper; Braziers' Art, or Light Coppersmithing; First Year's Experience; Repairing and Tinning; The Boy's Second Year; Making Washing Coppers; Making Small Brewing Coppers; Table of Dimensions and Capacity; Making Hand Bowls; Making Frying Pans; Making Closet Pans; Making Water Balls; Mounting for Copper Goods; Glue Pots and Tea Kettles; Oval Tea Kettles; Beer Mullers; Funnels; Coffee Pots; Saucepans and Pudding Pots; Stewpans; Stock Pots; Fish Kettles; Brazing Pans; Tea Boilers; Warming Pans; Preserving Pans; Dripping Pans; Coal Scoops and Coal Hods; Making Coal Scoops; Planishing and Smoothing; Cranes or Syphons; Pumps; Appliances of Railway and Marine Coppersmiths; Making Copper Pipe; Piecing and Joining Pipes; The Fire Pots; Fire Pot Set for Brazing Joint; Soft Soldering Large Joints; Taking Templates: Filling and Bending; Making Bends; Template Boards; Patching Pipes; Outlets; Expansion Joints; Tee Pieces; Three-way Pieces; Cross or Four-way Pieces; Saddle Fire; Marine Work; View of Maudsley, Sons & Field's Shop; Making Large Bends; Making Double Bends; Brazing on Flanges; Short Bends; Air Pipes for Ships; Making Hollow Spheres; Brazing Sheet Brass; Locomotive Brass Work; Brass Dome Covers; Heavy Pipes for Breweries; Brewing Coppers or Kettles; Dome Coppers; Dome and Pan Coppers; Tallow Coppers; Dyers' Coppers; Sugar Tieches; Stills.

Sent post-paid upon receipt of price.

The Business Situation.

The general business conditions throughout the country show very little change from last week. Reports to the mercantile agencies indicate a rather smaller distribution at most centers of trade, although the comparison with previous seasons is still largely in favor of the present. The volume of trade, as shown by returns of bank clearings, continues remarkably large, except at the South, in which section the yellow fever scourge imposes an increasing bar to business in all lines. While the bank clearings in New York last week were more than 40 per cent. better than those of the corresponding week of 1896, the figures for New Orleans showed a decline of 20 per cent. For the whole country last week's clearings exceeded $1,300,000,000, being much greater than in any corresponding week of previous years. For the first three weeks of October they establish a record never before reached. For the most part, prices remain steady, but some few declines are noted. Wheat is a shade lower and corn and cotton are down also. The latest reports indicate a very large wheat crop—one of the largest ever gathered—and the current exports of the cereal are among the heaviest on record. Corn shipments, however, have droped off to some extent. The corn crop promises to be large, and, with the stock left over from last season, it will be abundant for home use and for liberal exports. Winter wheat has been helped by heavy rains. In the metal trade, the most sensational event has been a slump in pig lead, which was caused by the unloading of speculative holdings. The market dropped from 4.10 cents in St. Louis to 3.70 cents. The iron and steel market is quieter, but prices continue strong. A pronounced scarcity exists in steel billets and in some classes of finished material. Proof of the great improvement which is taking place in the revenues of the transportation companies is given in the *Financial Chronicle's* compilation of gross railway earnings. In the month of September, 133 roads, operating 100,000 miles, made a gain of $6,386,000 or 14.14 per cent. over September, 1896, the largest increase ever shown in any previous monthly statement. Preliminary reports for the first two weeks of October indicate that this improvement is being fully maintained. A substantial decrease in failures is also reported, the aggregate of liabilities last week being less than for the same week in any previous year. The local money market has eased off on the recent influx of gold from abroad and an expansion in the bank reserves. Stocks have reacted from last week's depression in prices, and a leisurely advance has taken place almost all along the line, stimulated by heavy buying of American securities abroad. There is some complaint about collections in the East; but, as a general rule, they are reported as satisfactory.

An Exposition of American Manufactures.

Plans are being completed for a National Exposition of American Manufactures on a large scale, to be held next year in Philadelphia. The undertaking will be conducted under the joint auspices of the Philadelphia Commercial Museums and the Franklin Institute, aided by a strong committee of leading citizens. Already the preliminaries have been decided upon and plans laid out for the erection of a suitable building in which to hold the exposition. This building will be of a permanent character, so as to be available after the exposition for one of the departments of the Philadelphia Museums. It is practically decided to put it up on the Museum's property on the west bank of the Schuylkill River, south of the South street bridge. The proposed exposition is designed to include, in addition to all kinds of goods of American manufacture, the raw products of the United States, so as to make it practically an exhibition of all articles of export. This would embrace grain, minerals, woods, &c. Such an exhibit would be well calculated to attract a large number of foreign merchants to the Quaker City. The exposition, moreover, will be a valuable object lesson for the two or three hundred delegates from Chambers of Commerce all over the world, who, in October, 1898, are expected to attend a fifteen days' trade congress arranged for by the Advisory Board of the Philadelphia Museums.

The supply of boiling water from street gas lamps is an adaptation of the coin-in-the-slot system recently introduced in England, which, according to the *Colliery Guardian* of London, promises to prove a very popular and beneficial institution. The machine takes the form of a handsome street lamp, with a large base which contains a cistern holding 40 gallons of water. Cold water is fed into a spiral coil and preheating chamber above the light, and there converted into steam by the heat. The steam is then expelled by its own expansive force down the base, where it heats the water in the cistern by circulation through an iron coil, so that the steam does not actually come into contact with the water to be supplied to the public. The directors of the company formed to exploit the system claim that not only could they utilize the waste heat of the lamps in London, but that at 1 cent a gallon they could pay for the gas and for the water used and then leave a large margin for profit.

The annual report of the Director of the United States Mint, covering the operations of the Mints and Assay Offices for the fiscal year ending June 30, 1897, shows the coinage executed during the year as $1,646,705 in gold coins, $21,203,701 silver dollars, $3,124,085 in subsidiary silver and $984,509 in minor coins. Mint Director Preston in his report gives the value of the world's product of gold and silver for the calendar year 1896 as $204,396,600 and of silver in coining value as $215,242,700. The coinage of gold and silver in the various countries of the world in 1896 he places at $195,899,517 of gold and $153,395,740 of silver. Mr. Preston attributes the decline in the value of silver since 1873 to the great increase in production.

THE LETTER BOX.

Galvanized Iron and Galvanized Steel.

From Furnaceman, New York.—I note the inquiry of your Brooklyn correspondent in *The Metal Worker* of September 4, and also the poetic (?) contribution on the same subject. I have been for a number of years endeavoring to purchase an iron that would stand, as I have found in my furnace work that the steel of to-day has nothing like the lasting qualities of the iron of a quarter of a century ago. In a number of instances I have made my specification and furnished the sample and ordered sheets in large quantities, with the hope of getting sheet iron, but invariably have been unsuccessful. I have found in experimenting that the accumulation on furnace drums and in the smoke pipe, when saturated with moisture, generates a weak sulphuric acid which attacks the material and starts a rust which eats out the steel very quickly. Having learned this I have made it a point to test the various samples of steel (which I bought for iron) in order to know whether they would stand in use. I have used a solution of 25 parts of sulphuric acid and 75 parts water, and suspended the samples of supposed iron in it, having previously weighed them very carefully and accurately on a chemist's scales to get the weight in grains. The best bloom iron which was known to the tinner of former years will stand this test with so little loss as to be hardly noticeable. The greatest loss that I have found in material of this kind was a fraction over 1 per cent., while with steel I have records of a loss of 90¾ per cent. I have brought this to the attention of the manufacturers, and the best success that they have been able to reach in producing a substitute for iron has shown a loss of but 19 per cent. under my test, and this has varied up to 35 per cent. loss.

Wants to Make a Peppermint Test.

From W. F. S., Escanaba, Mich —I would be pleased to have the following question answered in The Letter Box. I have a contract for a job of plumbing that specifies an oil of peppermint test and I would like to know how to apply it.

Answer.—This question has been treated a number of time in *The Metal Worker*, and we reprint the following from a previous issue: Owing to the strong pungent odor of the oil of peppermint, in a test of this kind it is safest to have two persons take part in the work. One should ascend to the top of the building, on the outside, where the vent pipe comes through the roof, provided with a bucketful of hot water and a bottle containing from 2 to 4 ounces of oil of peppermint, according to the size of the building. All the windows of the house and openings into it should be closed. The more experienced plumber should then be on the inside of the building, and at a prearranged time the workman on the outside of the building should pour a small quantity of the hot water into the vent pipe, then pour in at least 2 ounces of the peppermint, after which he should pour in the remaining quantity of hot water and cover the opening with a cloth of some kind to prevent the escape of the pungent odor. By means of the hot water the oil of peppermint will be carried down to the horizontal drainage pipe, and in a short time the entire system will be filled with a peppermint odor. If any of the trap seals are broken or the plumbing work is defective, either in the calking of the soil pipe joints or the wiping of the joints connecting the traps with the soil pipe, the odor will find an entrance, which will be detected by the plumber on the inside of the building, who should visit each of the various fixtures and lines of drain pipes in the building for the purpose of learning if there be any leaks. The greater the care he uses in his search the less will be the likelihood of any leaks in the drainage system escaping his notice. If the vent pipes have not been properly arranged, so that it is possible that the traps in some of the fixtures have been siphoned, this will be quickly learned from the strong odor that will enter the building. If the work has been properly planned and properly executed, however, the test will bring to light no defects.

Sheet Metal Supplies for the Klondike.

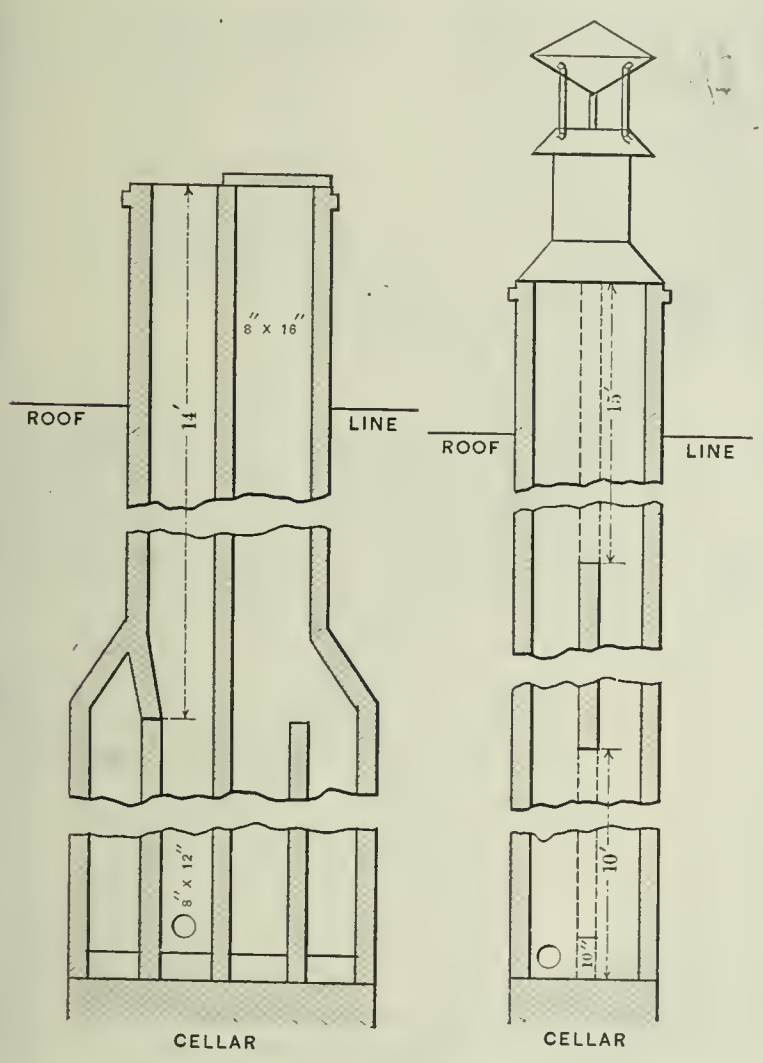
From C. N., Philadelphia, Pa.—I would like to find out what the prospects are for work and trade in the tin, sheet iron and stove line at Seattle, Wash., or Dawson City. I am thinking of going to one of those places to engage in that line of business in view of the coming spring rush to the Klondike. It seems to me there will be a big demand for sheet iron stoves and other metal work used in the mining districts, but there are a good many things to be found out before taking this step concerning freight rates, nearest point for purchasing supplies, kind of work to be expected, prices, &c. I do not suppose any very accurate kind of answer can be given to these questions, but any information you could furnish would be very much appreciated, and I believe a number of other readers would be interested in what you would say on the subject.

Answer.—The excitement over the wonderful gold discoveries in the Klondike region has given rise to all sorts of exaggerated reports, and it is not easy to get a plain, business statement of affairs in that part of the country. We have, however, endeavored to secure some reliable information for the benefit of our correspondent, and we have been favored with a letter from a Seattle correspondent, who is perhaps as well posted as any one concerning the chances for trade in that region. From this letter we extract the following information: The present freight rates from Seattle to New York, Chicago and Buffalo on sheet iron and tin are 70 cents per hundredweight, this being a drop of 4 cents from the rates of two months ago, the previous rates having been as high as $1 per hundredweight. The last drop was made to meet competition with water rate by way of Cape Horn on home and foreign shipments. The Seattle jobbing market has consumed 25 carloads of sheet iron and three carloads of tin in the past year. This does not include roofing material or the very large amount used by the salmon canneries, which buy direct in Europe and the East. The Yukon outfitting trade has kept ten to fifteen firms busy as they could be during July, August and September, and the prospects are that any one going to Seattle with sufficient capital to enter into competition with local firms will have a fair show of success. Seattle is believed to be unquestionably the best and nearest city from which to start in business to reach the Klondike trade. It is the last port of departure for Alaska from the United States, and every vessel which has gone north this season has either left Seattle direct or touched there as the last port. Sixty-five vessels left for the north during the past season in 68 days. Furthermore, Seattle is the only point on the Pacific Coast which is directly reached by three of the competing transcontinental railroads. Our correspondent who furnishes this information does not think it advisable to start in business at Dawson City, as that is only a mining camp, while the supply point for Dawson City and the rest of Alaska Territory is Seattle. If "C. N." would like further information we would suggest that he send for the Klondike edition of the Seattle *Post-Intelligencer*

for Wednesday, October 13. This is an eight-page paper, giving very complete and thorough information about the Klondike outfitting trade for that region and a great deal of miscellaneous information relating to it. The *Post-Intelligencer* will be sent to any address, we understand, for 75 cents per month, or $4 for six months, and will probably keep our correspondent, "C. N.," advised of all important matters relating to trade in that country.

Solving Chimney Problems.

From C. F. H., Brooklyn, N. Y.—Having seen a number of inquiries for assistance in overcoming chimney difficulties, I relate the following for the benefit of those who may be interested. It is well known in the manufacturing houses where heating apparatus is a specialty that the chimney is never at fault, but it is always the furnace, steam heater or the hot water boiler that will not draw, so complaints come in from customers. In one instance I was sent to a place to apply a remedy where a boiler having ample capacity to carry the radiation connected with it utterly refused to heat the building because it would not draw. On arriving I found a chimney of the character shown in Fig. 1. This chimney was so located in the building that it was only used for the heating apparatus, and, as will be seen, there were four 8 x 12 flues running up from the cellar through the building. These flues merged into two 8 x 16 flues near the top, a partition 4 inches thick being run up from the cellar. Fourteen feet below the top of the chimney the side flues in each case were drawn over and an opening was left at the top of the 4-inch partition which divided them from the central flue.



Solving Chimney Problems.—Fig. 1.—Leaky Partitions Make Four Flues Into One.

Fig. 2.—Utilizing Two Flues as One.

The heating apparatus was attached to the flue as shown by the round opening for the smoke pipe at the bottom. There was a square opening at the base of each of the other flues, so that they might be cleaned in case of necessity. On arriving the heater had a fire in it which was in a dull condition, only needing a strong draft to make a bright fire. I had the smoke pipe detached, and on looking up the chimney to which it was connected could see daylight, and this was the reason why it had been selected for use with the heater. The operation, however, clearly showed that something was wrong, and I went up on the roof and had a candle placed in the bottom of the flue that had been used and the outside flue next to it at the bottom. This showed a down current which blew out the candle. The candle, however, was lit long enough for me to see that there was an opening from the side flue into the central flue, and also I could readily see that there were but two flues at the top. I was firmly convinced that a portion of the air traveling up the chimney went down at the side flue; consequently I measured the distance from the top of the chimney to the partition I then had a hole cut in the side of the chimney and the side flue stopped off. I then went into the cellar and had the openings in the bottom of the side flue cemented tight. On connecting the smoke pipe the heater did better, but the chimney failed to work as it should. I concluded that the partition between the flues was no longer in an air tight condition, for from previous experience I had learned that the mortar would be eaten out by the gases and a partition of that character prove of very little assistance in separating two flues I then had the openings at the bottom of the two flues which were not in use cemented tight, which gave me another improvement, but not sufficient. My next step was to put a flat stone on top of the chimney that was not in use and cement it tight. I now had the flue which was in use so fixed that no air could get into it except through the smoke pipe at the bottom, and all who were interested in the case were delighted to see the fire burn up as it should and the heating system work in a manner which was entirely satisfactory from every standpoint.

On another occasion I was called to see a "sick" job, where the heater would not draw, nor would it carry the radiation connected with it. I immediately commenced to investigate the chimney, and although it was of the peculiar shape of 9 x 10 inches, it was not large enough for the boiler connected with it. In this case there were two flues, side by side, as shown in Fig. 2, and when I saw the chimney did not have sufficient capacity it was suggested that an opening be cut in the partition between the two flues at the bottom. In disconnecting the pipe preparatory to this work I found that the pipe was shoved into the chimney so far that it entirely cut off the draft. When the pipe was changed the chimney still did not work as it should, and I proposed that instead of running the pipe into the chimney from the side, a round elbow be used connected with the chimney at the bottom. The proposition to cut a hole between the two flues so that both could be used for the heater did not meet my views, as I told them it would produce a circulation and impede the draft rather than aid it. However, this was done with the effect I had predicted. The opening in the bottom of the second flue was made and an iron bar was used to break away the partition between the two flues as far up the chimney as could be reached, which was about 10 feet. I then went on top of the roof and was successful in having the partition between the two flues removed for a distance of about 15 feet, so that while the flue was divided for a considerable distance it yet had some of the benefits of a single flue of 10 x 18 inches in size. With the aid of an Emerson cap on top of the chimney the difficulty was removed, and the apparatus went ahead and carried the radiation connected with it and heated the building satisfactorily.

Patterns for an Emerson Ventilator.

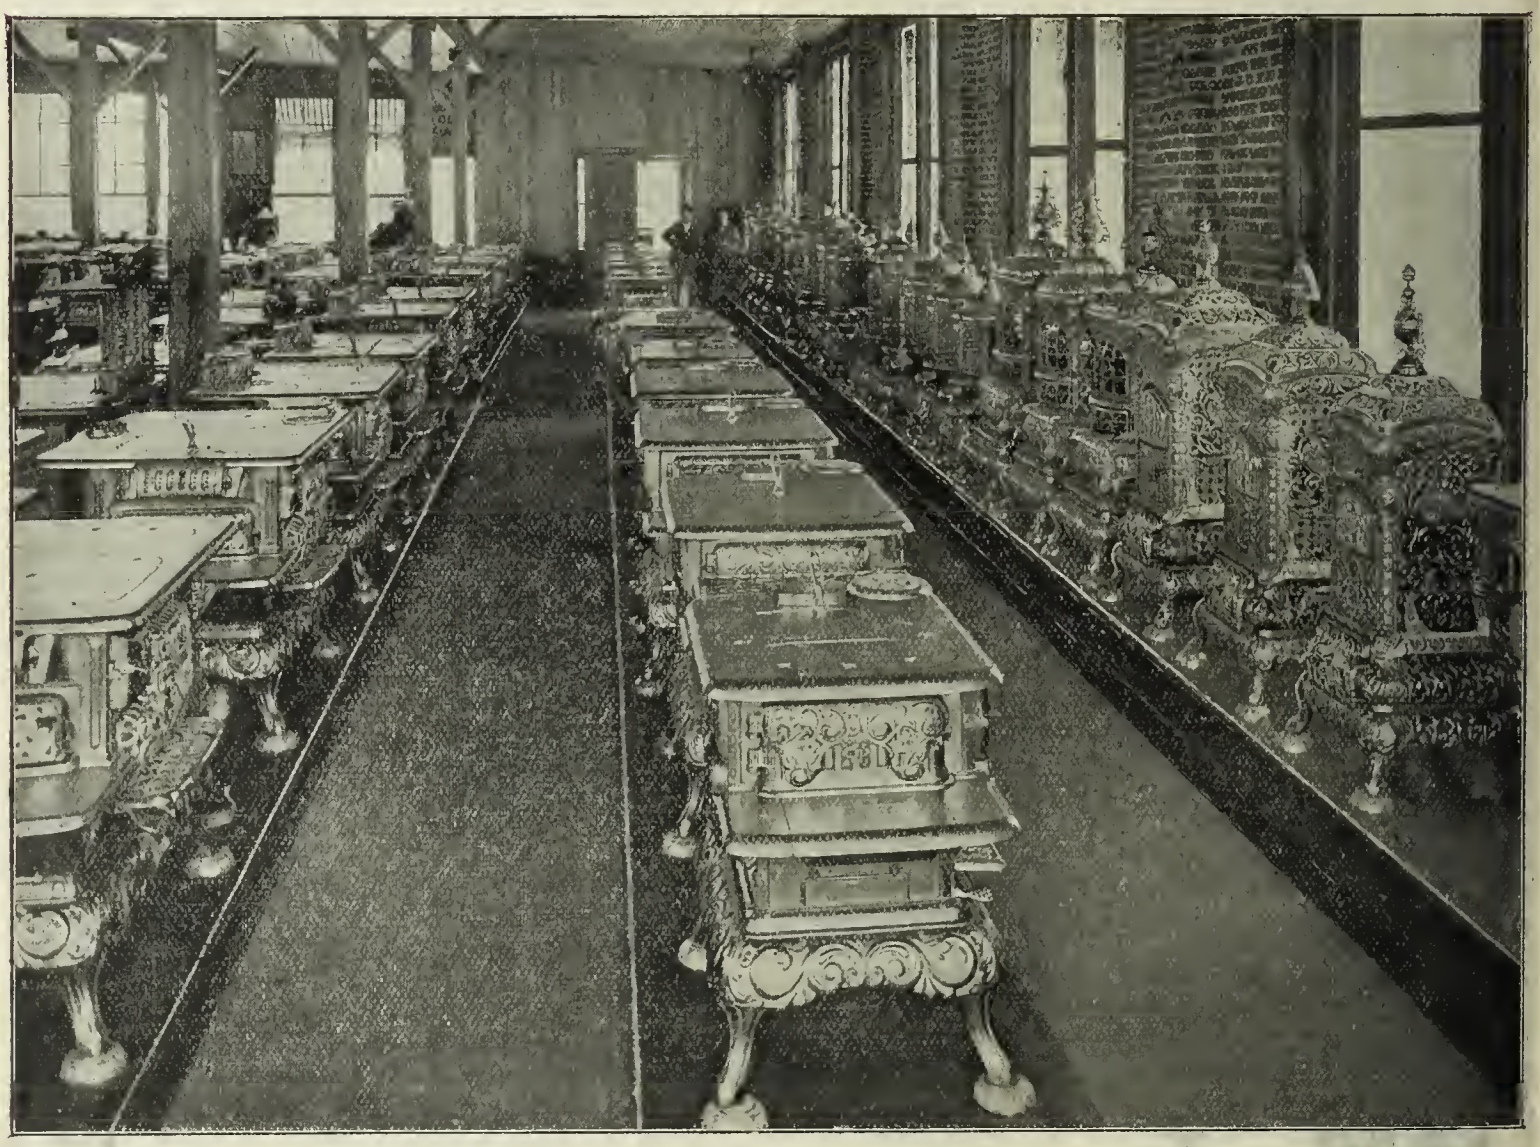
From T. B. D.—I notice an article on patterns for Emerson ventilator by "W. N.," in the issue for October 9; but the form there given is all wrong, as the real Emerson ventilator has no cone above the opening from the flue or chimney, there being simply a flat plate. The only conical piece is that around the edge, as "W. N." showed.

STOVE TRADE NOTES.

Plant of the Charter Oak Stove & Range Co.

We present herewith a number of views representing various departments of the plant of the Charter Oak Stove & Range Company, St. Louis, Mo , who are manufacturers of the well-known line of Charter Oak stoves and ranges. While the company have only been in business something less than two years, they have rapidly forged to the front, and in addition to building up a large and profitable line of trade have improved and modernized their plant to a point where it will favorably compare with other stove manufacturing plants in the country. We have secured a number of photographs of different departments of their works and present a series of engravings which demonstrate more forcibly than words can describe the large and commodious plant which this company have at present in full operation. It occupies two city blocks, or an area of 4½ acres. They manufacture a full and complete line of first-class, medium and low priced cooking stoves, ranges, heating stoves, laundry, tailors' and miners' stoves, and in addition make a full and complete line of steel ranges, which are offered under the names of Charter Oak and Excelsior.

Charter Oak stoves and ranges have been made since 1852, and have been on the market continuously since that time. The company advise us that the demand for this line of stoves and ranges is of sufficient proportions to indicate that they have not as yet lost any of their popularity. The sample room and office building is 80 x 112 feet, and is substantially built of brick with a very attractive galvanized iron front, painted in imitation of stone. The firm name, which appears immediately above the windows, is in raised gilded letters, forming a very striking contract against the stone effect. The center cornice above the entrance carries in metal the well-known trade-mark of the company, the words "Charter Oak Stoves" and the rays radiating from the center of the trade mark being gilded. The interior of the building is finished in hardwood, being well ventilated and lighted by large and airy skylights. The aisles are wide and the platforms carrying their lines of sample stoves are painted a bright red and then treated to several coats of varnish. These platforms are 15 inches in hight. This building contains all the necessary conveniences incident to an office and sample room, being provided with bathroom, stationary washstands, coat closets, room for stationery and office supplies, fire proof vaults, &c. On the sample floor are nearly 300 different stoves from the highest priced base burner, handsome and artistic in its design and finish, to the much reviled but still virtuous "air tight" stove commonly referred to as the "tamale." In Fig. 1 of the engravings is presented a view of the south side of the sample room, showing a portion of the company's line of cooking stoves, ranges and heating stoves, and in the distance the office of the vice president and general manager. At the right and left hand of the main aisle of the room are arranged the Royal Charter Oak and the Grand Charter Oak stoves. At the north side of the sample room is to be found a line of high grade cooking stoves and ranges, medium priced cooking stoves, and at the extreme rear against the wall is arranged a line of Charter Oak and Excelsior steel ranges.



Plant of the Charter Oak Stove & Range Company —Fig 1.— View in Samp'e Room, Showing a Portion of Two of the Side Aisles, with Office of Vice-President in the Distance.

Fig. 2 of the engravings represents the interior of the private office of Vice-President and General Manager Geo. D. Dana. This office is finished with hardwood floor and ceiling, and the side walls carry a number of fine engrav-

ings. An old fashioned fire place gives a feeling of comfort and genial warmth to the room. Here Mr. Dana can be found daily. On the mantel are a number of photographs of Mr. Dana's personal friends, the place of honor being accorded a steel engraving of Giles F. Filley, the veteran stove manufacturer and founder of the Excelsior Mfg. Company, to whom the Charter Oak Stove & Range Company are successors.

Fig. 2.—Interior of Private Office of Vice-President and General Manager G. D Dana.

Fig. 3 of the engravings shows Secretary L. D. Vogel's office, with salesman's desk and stenographer's quarters, while Fig. 4 shows the treasurer's office, bookkeeping and billing department. Outside the warehouse is a railroad switch 690 feet long, with facilities for handling ten cars at a time. The cars are run right up to the doors of the shipping department, and goods are loaded and unloaded in the least possible time. Fig. 5 of the engravings shows the molding floors, and practically speaks for itself. It is one of the largest in the country, and a glance at the engraving will readily convey an idea of its immensity.

This company are now employing over 400 hands, and have a cupola capacity of melting 78 tons of iron daily if necessary, and their total pay roll now amounts to $25,000 per month. A steady increase in their business is noted from month to month. Their business for September showed an increase of over 140 per cent. in comparison with the corresponding period of last year. The officers of the company are as follows: President, Wm. Duncan; vice-president and general manager, Geo. D. Dana; secretary, L. D. Vogel; treasurer, Theo. H. Hammond.

A recent issue of the Richmond *Times* contains a very interesting description of the works of the Richmond Stove Works, Richmond, Va. It refers to the progressive character of the management, and to the fact that there is probably no one industry in the city "which more thoroughly represents the ingenuity and practical business tact of the Virginian." W. J. Anderson, the president, and R. G. Reynolds, the secretary and treasurer, to whose well directed efforts the success of the company is largely due, are among the leading exponents of the "patronize home industry" idea, and they evidently practice what they preach, in the hope that it may help the city and indirectly, of course, themselves. The company have a large and growing business covering a wide territory, although their greatest efforts are put forth in connection with the large local trade.

Fig 4.—Office of Treasurer Theo H. Hammond, and Bookkeeping and Billing Departments.

A little circular of pale blue paper is received from Gurley Lester, Capac, Mich. The circular makes a forcible presentation of the advantages of the Favorite Stoves

and Ranges, the trade-mark of these goods occupying the center. Those who receive the circular cannot but be impressed with the fact that the Stoves which it exploits are well worthy of an investigation by prospective purchasers.

Report of Montana State Commission on Heating.

The sections of the report of a special commission to the Governor and Board of Education of Montana treating of steam, hot water and hot air heating have appeared in previous issues of *The Metal Worker*, and the following is the conclusion arrived at as a result of their investigations:

Taking the measure of good ventilation as a standard, we weed out all methods which do not provide for it, and this leaves for our consideration two general methods of heating—viz., steam heating and warm air heating, and but two subdivisions in each class, viz.:

A. Steam heating by indirect radiation and gravity ventilation.

Fig. 3.—View in Office of Secretary L. D. Vogel.

B. Steam heating by indirect radiation and hot blast ventilation.

C. Warm air heating by the gravity system of ventilation.

D. Warm air heating by hot blast system of ventilation.

In comparing indirect heating and ventilation above mentioned, and granting that good construction in either will give equally as good results, we come to consider the other items of safety, first cost, and cost of management and maintenance.

Safety: It will be immediately granted that a warm air or furnace system is, when properly installed, a safe system. It will not set the building on fire, and it cannot blow up or freeze up. It will also be granted that there is no danger from fire with a steam system properly installed.

We are considering the matter as it relates to the installation of a heating plant in our public buildings in Montana. We have never given this matter of the safety of a steam boiler much thought, because, fortunately, we have never had a boiler explosion in any of our public buildings.

This may be attributed to the fact that all of our buildings fitted with steam heating apparatus are comparatively new. But it is a startling question, and we now feel satisfied that danger exists and an explosion may happen at any time, and we would recommend that all steam boilers in use in our public buildings be subjected to a rigid inspection, and if found in a dangerous condition, that they be immediately made as safe as possible, or removed and a safe apparatus put in. We also think that our Legislature should be asked to pass a rigid boiler inspection law, making the same applicable to heating plants. To give you some idea of the danger in the use of steam boilers, we refer you to the following reports from State Inspectors and also to the daily press, for since attention has been called to it we note that hardly a day passes that some such accident does not occur in some portion of the country.

The State of Massachusetts is divided into districts, and each district is in charge of a district inspector. These inspectors make an annual report to Rufus W. Wade, Chief of Massachusetts District Police and Chief Inspector of Factories and Public Buildings. Chief Wade makes a detailed report of all the district reports to the Governor of the State, and we quote from his reports relating to the dangerous condition of boilers and the incompetency of men in charge of them. The summary of this report for 1893 is as follows :

Out of a total of 171 boilers inspected, 481 defects were found, and 114 were pronounced dangerous. In conclusion, Chief Wade says : "I cannot too earnestly recommend the enactment of a law providing for the inspection of all steam boilers and the licensing of all persons in charge thereof. . . . The safety of the public requires this safeguard." In the report of 1894 we found 14 pages devoted to defective boilers and incompetent persons in charge, and he ends with the following summary and recommendation : "Number of boilers inspected, 405 ; number of defects, 842 ; dangerous, 169. My previous reports have called attention to the fact that defects in boilers are very common in school houses, and they are decidedly more dangerous because the steam is liable to be shut off entirely by the teachers, and the janitor is away, with no one to take care of the hot fire. There are other boilers in use equally as dangerous, and as they are never inspected, no one knows anything about them. The janitor gives them scant attention, and every one about them is living in fancied security that being low pressure boilers they can never do any harm. Quite a number of these low pressure boilers have exploded lately and with disastrous results. They are safe if properly designed, so long as the pressure is low, but the inability to keep the pressure low is a defect very common in many of them. Every safeguard should be provided and made

compulsory to guard against increase in pressure, as well as against deterioration in the boiler."

First Cost: This is a determination hard to arrive at, because no two buildings are alike, and, therefore, the first cost will differ. The information we can obtain, however, leads us to believe that the first cost of a steam system will be much greater than the first cost of a warm air system.

Cost of Management and Maintenance: The cost of maintenance is the cost of labor and the cost of fuel. On the first item we have shown that, in the management of a steam plant with safety, a licensed engineer is necessary, and his presence should be continuous about the plant. This kind of labor is high priced and involves an extra expense for janitor services.

In the management of a warm air plant, on the other hand, we found the janitor able to do both. In the matter of cost for repairs we have no reliable data and can only judge from our own observation. This would lead us to conclude that the necessary repairs for a steam heating plant would greatly exceed the wear and tear on a less complicated furnace system.

In the matter of fuel consumption we have more definite information. State reports and individual experiences furnish data upon which estimates may be made and conclusions drawn. From our researches and personal inquiry of parties in charge of different systems of heating plants we are led to believe that the cost of fuel under the furnace system, when the same is properly installed, is fully one third less.

We have often been puzzled in reading the reports of the expense of heating and ventilating buildings to notice the vast difference in cost, not only in different localities and systems, but in the same system and in the same locality. Our investigation on this point has led us to the conclusion that some of the reasons are: The quality of fuel and difference in faithfulness and efficiency of attendants, or their control by the principals or teachers, or of the teachers themselves. The above are potent causes for success or failure. But another, and not the least reason, is found in the kind and quality of materials used in the construction of the building proper. In this latter respect we have found that the thermometer indicated on a solid brick wall 12 degrees less on the windward side than on the leeward, and these differences are especially noticeable in Montana on account of greater prevalence of wind. This caused us to give attention to hollow walls and walls constructed of hollow brick, or brick with hollow tile linings. The latter we found 9½ degrees warmer than the solid brick walls, and this great difference in temperature, when considered for the whole outside wall of the building, would indicate that it is a point of economy well worth attention. To a large extent, also, should the subject of storm doors and double windows be considered and adopted in this climate.

Natural gravity is preferable, with a system as simple as possible. The carrying of supply or exhaust pipes on a level for any distance we found very detrimental to a satisfactory working, particularly if said pipes are carried through a cold room. In several instances where the exhaust pipes were carried 10 feet and more to a central exhaust shaft, the exhaust was diminished to such an extent that the supply was also seriously interfered with. This will be particularly noticeable if no mechanical force is employed with the supply. We find that it is not a very difficult matter, neither does it require large expense, to change the air in a room six times per hour; or if applied to persons, it should be 30 cubic feet of air per person per minute. Unpleasant drafts must be avoided under all circumstances. This can be done by proper inlet and foul air outlets without any difficulty.

Fig. 5.—Interior View, Showing Molding Floors.

In answer to the question, What is the best form of construction, or rather, which method of warm air heating we should use in the particular buildings we have under consideration, we would advise that it rest largely upon the advice of the engineer of the heating system we adopt. His experience in hundreds of buildings of a like character should render his opinion of more value, and it should be given more weight than that of those of less experience or a more limited information.

The Ringen Stove Company of St. Louis, Mo., have adopted the plan of attaching to each of their Quick Meal Steel Ranges a card giving in detail the special features embodied in the Range. The card is self explanatory, and the heading is as follows: "To the Salesman: This card explains briefly the special features of the Quick Meal Steel Range, and is intended as a reminder so as to help you explain them to your customer."

The Kernan Furnace Company, Beekman and Pearl street, New York City, are the Eastern agents for the Ferrosteel Registers, made by the Ferrosteel Company, Cleveland, Ohio, and announce in our advertising columns that they carry a full line of sizes in stock and are prepared to fill orders promptly.

The Standard Oven Indicator.

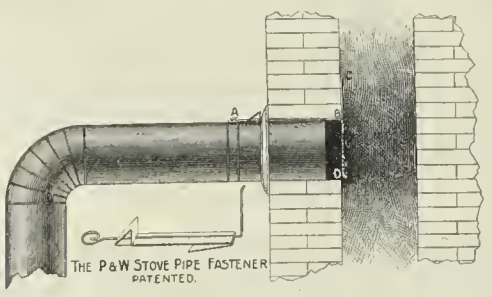
In the accompanying illustration we show the Standard oven indicator, made by the Standard Thermometer & Electric Company of Peabody, Mass. In a circular in reference to it they say an oven thermometer is one of the necessities of the time. By its use fuel is saved, by avoiding overheating and vexation is avoided by having the oven at the right temperature for any kind of baking, when the food is put in the oven, and the indicator gives evidence of a rise or fall in temperature while the baking is going on, so that if an even heat is required the drafts of the stove may be adjusted to maintain it. On the Standard indicator there is a dial from which all confusing marks or directions are removed. In its use experience will demonstrate the proper temperature for baking a given kind of food, and the hands on the indicator will

The Standard Oven Indicator.

mark the point on the graduated scale that is due to the temperature at which the baking is done. In future for similar work it is only necessary to see that the hand of the indicator reaches this point to know that the oven is ready for baking. The draft of a chimney will vary on different days and the operation of the stove will vary with it, and without an indicator to show the condition of the oven it has been the experience of many good cooks that the baking has been overdone or underdone. In construction the thermometer is described as free from complicated parts. The connection between the metallic thermal strip and the hand is direct, so that the motion is smooth and even, and it is pointed out that it is almost impossible for the hand to stick. The dial is enameled on copper, so that it is very durable. The indicator is about 3 inches in diameter and the dial is covered with glass. The case inclosing the sensitive parts is provided with lugs at each side for fastening to the oven door, the sensitive parts being placed inside the oven. It is necessary to cut an opening in the oven door through which the dial extends. This portion of the indicator is nickel plated, giving it an attractive appearance. It is pointed out that when the hand of the indicator reaches the word "hot," the oven is usually ready for baking. The exact position of the hand on the hot section of the dial at which the oven will do the best work for cooking, or the portion where bread bakes the best or turkey can be roasted to a turn, are points for each cook to decide with the stove on which it is used. These thermometers are used on the stoves of a number of New York and New England stove manufacturers and are said to have proven a very convenient attachment.

P. & W. Stove Pipe Fastener.

In the accompanying illustration we show the P. & W. stove pipe fastener, which is being put on the market by Powers & Williams of 401 East Main street, Streator, Ill. It consists of a stout wire and a heavy piece of sheet



The P. & W. Stove Pipe Fastener

metal. In use the directions state that the sheet metal should be turned in at the end of the pipe that goes into the chimney, with the end of the wire rod C turned down. When the pipe has been put into the chimney the proper distance, the wire should be given a half turn at A and pulled out until the end at B C is tight against the inside of the chimney. A fine piece of wire should then be run from A around the stove pipe elbow to hold the wire fastener in place. After the collar on the stove pipe is properly adjusted the sheet metal strip should be bent up with an offset to prevent the stove pipe from being pushed further into the chimney. The use of this fastener prevents the stove pipe being pulled out or falling in case of a severe jar, and also prevents the pipe being pushed so far into the chimney as to cut off the draft. Circulars giving full description and prices can be secured on application.

ODD PLATES.

M. D. Story & Sons, 121 Lake street, Chicago, Ill., have received the contract from George B. McKinney, Winnetka, Ill., to heat his large residence with a No. 159 Palace Queen Combination Heater, made by Russel Wheeler & Sons of Utica, N. Y.

Harry King, one of the representatives of Janes & Kirtland, 114 Beekman street, New York City, manufacturers of the Beebe Furnaces and Ranges, was a caller at *The Metal Worker* office this week.

Schill Bros., Crestline, Ohio, announce in another column, where they show a cut of their Steel Range, that for the convenience of the Northwestern trade they carry a stock with and have appointed Crandall & Nellson, Owatonna, Minn., distributing agents, so that the trade in Minnesota, North Dakota and South Dakota may have their orders filled promptly by addressing Crandall & Nellson Schill Bros. report the best trade they have ever enjoyed, and they have been compelled by increasing business to make an addition to their molding room, which has just been completed.

The New Magic Welcome Range is the up to date presentation of a Range that has been sold by thousands, which progressive dealers are invited to investigate. It is made by the Syracuse Stove Works, Syracuse, N. Y., with the A. J. Lindemann & Hoverson Company, Milwaukee, Wis., as Western agents. The claim is made that it will prove a bread winner to the dealer who sells it. A cut is shown in the advertising columns, and correspondence is invited.

According to latest advices Baldwin & Graham, New Castle, Pa., are giving employment to 110 men, 61 of whom are in the molding room. The latter is a powerfully built structure with roof so strongly girded that no supporting columns are used in its 20,000 feet of floor space. The mounting room is also of good size, being 235 x 60 feet in area. Every part of the work of making the well-known Good Luck Stoves and Ranges is done at this foundry except the nickeling of the trimmings. The company are said to be meeting with a very good demand for their Good Luck Gas Ranges.

A *Metal Worker* representative was recently shown a photograph which was suggestive of extremes in the Stove trade. The photograph showed J. W. Bogle of Dalton, Ga., and Franklin A. Thompson of Philadelphia, both salesmen of the firm of Chas. Noble & Co., Philadelphia, apparently deeply engaged in a discussion of the merits of Iron King Cook Stoves. The odd part of the picture is the disparity in the sizes of the two gentlemen, Mr. Bogle being 6 feet 2 inches in hight and Mr. Thompson 4 feet 11 inches. Their friends entitle the picture "The long and the short of it."

Chas. C. Heath & Co., Baltimore, Md., report very large sales of their new National Furnace, which, they state, is exceedingly gratifying to them in view of the fact that it was not brought out until the season was well advanced.

The Sheffield Stove Works of Sheffield, Ala., are meeting with a very gratifying demand for their Stoves, and are making frequent carload shipments to customers in various parts of the South. The demand for their Stoves is such that the company contemplate increasing their force as well as their output.

Charles O. Lyon, president of the Thatcher Furnace Company, 240 Water street, New York City, visited Boston this week in the interests of the Thatcher line of Heating and Cooking Apparatus.

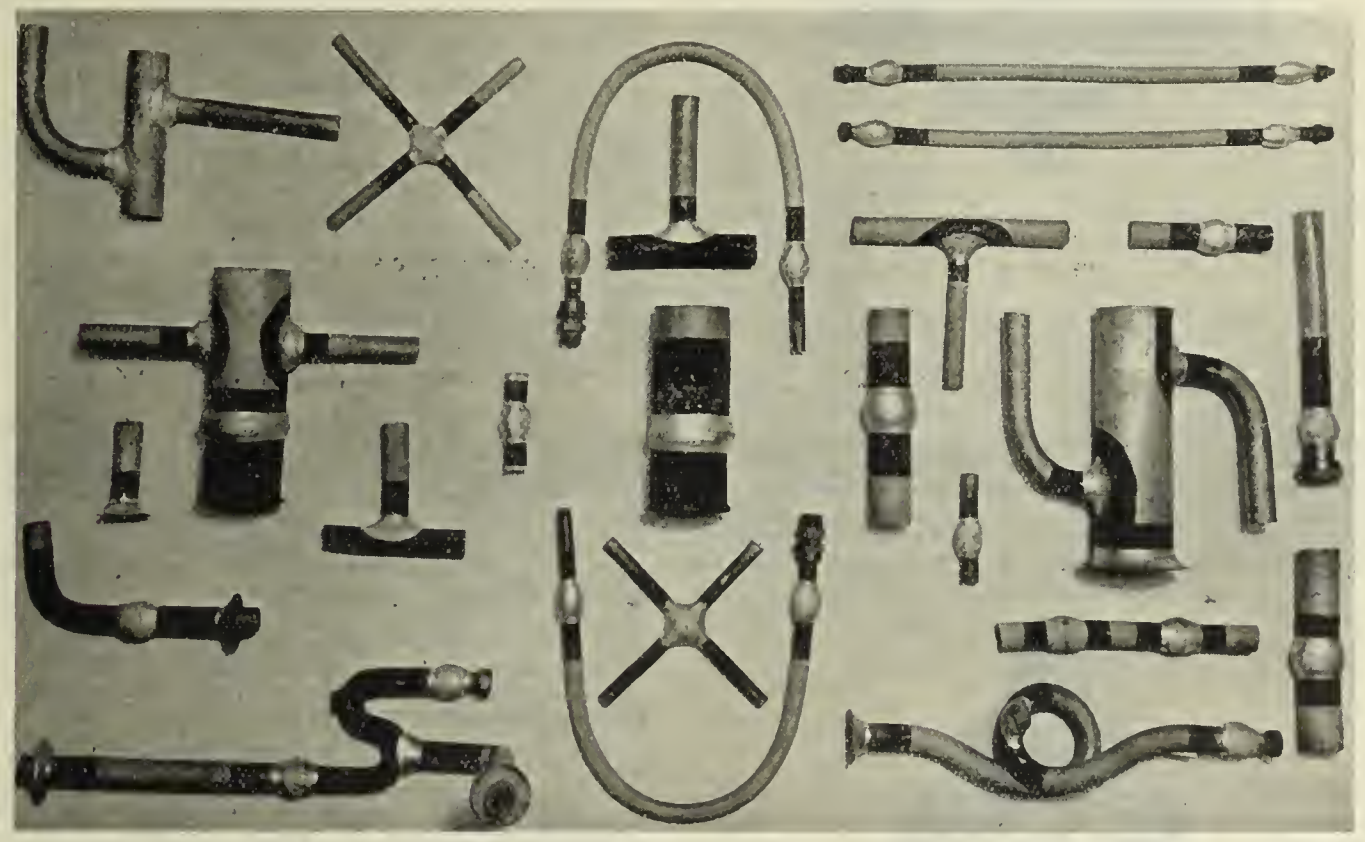
The City of Baltimore, Md., has an office—that of City Inspector of Furnaces—which seems to be ably filled by N. B. Shorey, who previous to his appointment had a long experience in the Hot Air Furnace business. Mr. Shorey has recently examined the school buildings of the city, and his report states that in a number of instances changes should be made to remove absolute danger and to secure a higher efficiency both for heating and improving the atmosphere in which the scholars must pass so much of their time.

Rathbone, Sard & Co. of Albany, N. Y., in recently resuming operations found it necessary on account of the rush of orders to open their shop No 2. This shop, we understand, has not been used since 1893. The goods which are being made are intended for the Eastern trade.

HEATING AND PLUMBING.

HILLYER INSTITUTE TRADE CLASSES, HARTFORD, CONN.

The fifth annual catalogue of the Hillyer Institute of the Young Men's Christian Association, Hartford, Conn., containing information concerning its evening educational classes for the season of 1897 98, has lately reached us. It contains, among other matters, full details regarding the good work that is being done at that institution for the young men of the city of Hartford in providing them with opportunities for trade instruction, which, although not claimed to be of so exhaustive a character as to make of the pupils finished tradesmen, yet is calculated to impart a sufficient knowledge of the principles of their trades to make better workmen of those already engaged in them, and to enable those not connected with any trade to learn enough to make their services of value to an employer.



Hillyer Institute Trade Classes, Hartford, Conn.—Specimens of Plumbing Work.

The trade courses taught at the institute embrace classes in plumbing, architectural and mechanical drawing, wood working, forging and electricity. The full course consists of two terms. The fall term began on Monday, October 11, and ends December 7, 1897. The winter term extends from January 10 to March 18, 1898. Each term includes 20 lessons, the classes meeting on two evenings of each week from 7.30 to 9.30 o'clock. Any young man over 16 years of age, of good character, is eligible for entry in the trade classes by becoming a member of the association, which costs $2 a year, and paying a further fee of $3 per term of 20 lessons. All the necessary tools are furnished free of charge.

We have had occasion in previous years to make particular mention of the excellent opportunities offered in the plumbing class of the Hillyer Institute. This class occupies a large room provided with work benches, gas furnaces, solder pots, and all the equipment necessary in the trade. It meets each Tuesday and Friday evening under the charge of Albert M. Smith. The instruction in the plumbing class is both manual and scientific. The manual instruction consists of making solder, wiping joints, sand bends, making traps, &c. The scientific instruction is given upon the proper arrangement of service and waste pipes and upon drainage and ventilation. The instructor has prepared a list of important questions which the students will copy into note books. He will give the answers to these and explain what is meant, after which they will be taken down for future reference. Last year's complete plumbing course was taken by 12 pupils who passed the required examination at its close. All but three of these young men belonged to Hartford, the others attending from nearby towns. The following is a list of the 1896-97 graduates :

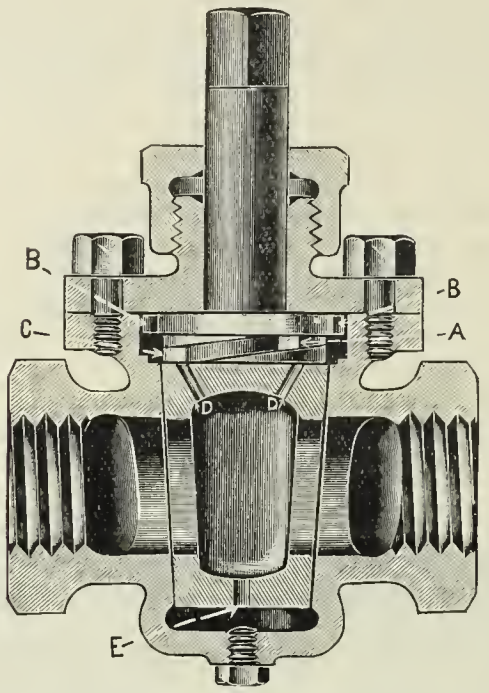
Avery, Arnold P. (South Manchester).
Burns, Edward A.
Dougherty, William.
Hills, John H. (East Hartford).
Hills, Rowland B.
King, William J.
Lindrey, William.
McMahon, M. F.
Moran, Michael.
Nordstrom, Peter A.
Trotter, Thos. (South Manchester).
Wapschal, Charles.

The progress made by these pupils is described as very creditable to them. The accompanying illustration shows examples of some of the work of the 1896-97 plumbing students. An exhibit of the work of the Hillyer Institute plumbing pupils, which was made last summer at the annual meeting of the American Manual Training Association, at New Haven, Conn., drew out many favorable comments.

Having accepted the position of Inspector of Gas Fixtures, Charles B. Gould has resigned from the Board of Examiners of Gas Fitters in Boston, Mass., and Marcus C. Poor has been appointed to fill the vacancy.

The Homestead High Duty Valves.

In the accompanying illustrations are shown the Homestead high duty valves, made by the Homestead Mfg. Company, Homestead, Pa., with Robert K. Story, 44 Centre street, New York, as Eastern agent. The valves are made straightway, three-way and four way for use under heavy pressure of steam, water or air. They are made of high grade material, and are sold for use under pressure from 100 to 4500 pounds per square inch. They are made from ⅛ inch to 3 inches, and larger sizes can be furnished to order. Friction and leakage in valve seats



The Homestead High Duty Valves —Fig. 1.—Sectional View of Straightway Valve, Showing the Homestead Construction.

are said to be obviated by the construction, the valve opening or closing by a quarter turn in the same direction as a globe valve. Balancing parts in the plug avoid resistance in operation. In construction the valve resembles the familiar plug cock, but is so arranged that when it is closed it is at the same time forced firmly to its seat, while when it is open the first effect of the movement to open it is to relieve the force which holds it to its seat and thus not only enable it to be very easily opened, but also preventing scored seats and leaks. This result is secured by means of the traveling cam A, Fig. 1, through which the

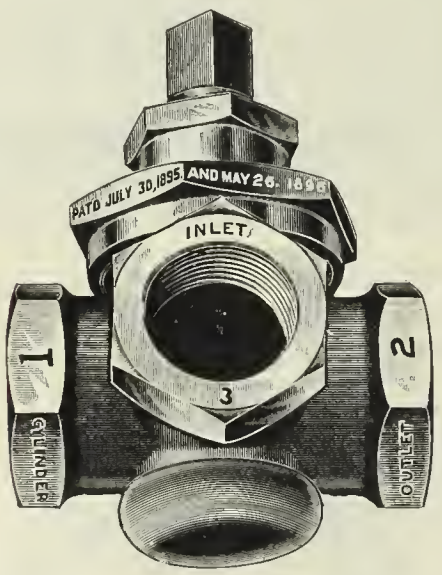


Fig. 2 —The Three-Way Valve.

stem passes. The cam is prevented from turning with the stem by means of the lugs B, which move vertically in slots. Supposing the valve to be open the cam will be in the lower part of the chamber in which it is placed and the valve will be free to be easily moved. A quarter of a turn in the direction for closing it causes the cam to rise and take a bearing on the upper surface of the chamber, and the only effect of further effort to turn the stem in that direction is to force the valve more firmly to its seat. A very slight motion in the other direction immediately releases the cam and the valve turns easily, being arrested at its proper open position by contact of the fingers of the cam at the other end of its travel. E D D are balancing ports. The bottom plug is for the purpose of draining valve to prevent freezing and also for the removal of sedi-

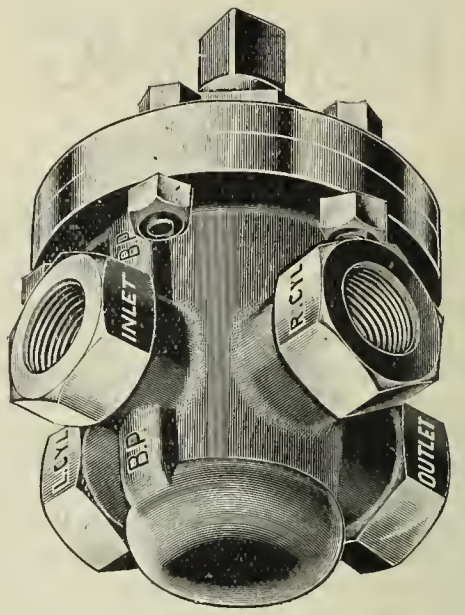

Fig. 3.—The Four-Way Valve.

ment. C indicates traveling cam. Under no condition, it is claimed, does the plug litt from its seat.

Plumbing Ordinance of Peoria, Ill.

The Mayor of Peoria, Ill., attached his name to the plumbing ordinance passed by the Council September 10, and the law will go into effect after the publication required by law. In view of the interest taken by the trade in this ordinance and the care that has been taken in it to secure an examination of plumbers, an inspection of plumbing and the regulations for sanitary work, we reproduce it herewith in full :

ARTICLE I.

Section 1. There is hereby created a Board of Examining Plumbers, which shall consist of the chairman of the Board of Health, who shall also be chairman of said Board of Examiners ; a second member, who shall be a master plumber, and a third member, who shall be a journeyman plumber. Said second and third members shall be appointed by the Mayor, by and with the consent of the City Council, at the first regular meeting of the City Council in the month of August, 1897, or as soon thereafter as may be, which appointees shall hold office until the first regular meeting of the City Council in May, 1898, and until their successors are appointed and qualified, and thereafter the term of office shall be for one year.

Sec. 2. Two members of said Board of Examiners shall constitute a quorum for the transaction of all business.

Sec. 3. It shall be the duty of the Board of Examiners to examine all applicants desiring to engage in the work of or business of plumbing, whether as master or employing plumber, or as journeyman plumber, as the case may be. Said board shall examine said applicants as to their practical knowledge of plumbing, house drainage and plumbing ventilation, and if satisfied of the competency of such applicants shall thereupon issue a certificate to each such applicant authorizing him to engage in the work or business of plumbing, whether as master or employing plumber or as a journeyman plumber, as the case may be. The fee for a certificate for a master plumber or employing plumber shall be $5, and for a journeyman plumber $1, which said feel shall be paid to the treasury of the city.

Sec. 4. Every person desiring to work either as a master plumber or as a journeyman plumber in said city of Peoria who has no license, shall apply to the Board of Examiners and procure a certificate before entering upon such work.

Sec. 5. Any person who shall engage in the work or business of plumbing, either as a master plumber or as a journeyman plumber, without having first obtained a license or certificate from a duly qualified Board of Examiners within the State of Illinois, shall be deemed guilty of a misdemeanor and be subject to a fine of not less than $5 nor more than $50.

Sec. 6. The Health Officer shall receive no extra compensation for his services as chairman of the Board of Examiners other than his regular salary as Commissioner of Health ; the master plumber and the journeyman plumber shall each receive $5 for each and every meeting of the board ; Provided that in case the Plumbing Inspector is a

member of the board he shall receive no extra compensation for his services thereon.

Sec. 7. The Board of Examining Plumbers shall meet on the second Tuesday of each and every month at the office of the Plumbing Inspector.

ARTICLE II.

Section 1. There is hereby created the office of Plumbing Inspector, who shall be appointed by the Mayor, by and with the consent of the City Council, at the first regular meeting of the City Council in the month of August, 1897, or as soon thereafter as may be, which appointee shall hold office until the first regular meeting of the City Council in May, 1898, and until his successor is appointed and qualified, and thereafter the term of office shall be for one year. The Plumbing Inspector shall be either a master or a journeyman plumber, and may be a member of the Board of Examiners of Plumbers.

Sec. 2. No person shall be appointed to the office of Plumbing Inspector who is not reasonably skilled in the business of plumbing, house drainage and plumbing ventilation, and who is not a resident of the city of Peoria and a citizen of the United States ; and hereafter he must hold a plumber's license when appointed

Sec. 3. Said Plumbing Inspector shall, before entering upon the duties of his office, execute a bond to the city of Peoria in the sum of $5000, with two or more sureties thereon, to be approved by the City Council of the city of Peoria, conditioned for the faithful performance of his duties, and take and subscribe to the oath prescribed for city officers.

Sec. 4. Said Plumbing Inspector shall not engage in the occupation of plumbing, house drainage or plumbing ventilation or be interested directly or indirectly in any firm or corporation engaged in the business of plumbing, house drainage or plumbing ventilation during his term of office. He may be removed for cause at any time by the Mayor.

Sec. 5. The Plumbing Inspector may, as far as necessary in the performance of his duties, enter in the daytime any building or premises in the city of Peoria.

DUTY OF INSPECTOR TO INSPECT.

Sec. 6. It shall be the duty of the said Plumbing Inspector to see that the construction, maintenance and control of the plumbing, drainage and ventilation of all buildings in the city of Peoria shall hereafter conform to and comply with the rules and regulations established by this ordinance.

INSPECTOR TO ISSUE PERMITS AND KEEP RECORD

Sec. 7. It shall be the duty of the Plumbing Inspector to sign and issue all notices and certificates required, to pass upon all plans submitted, to keep a daily record of his work, including all notices and applications received, permits granted, violations of these regulations and all other matters which may pertain thereto ; he shall inspect all houses in course of erection or undergoing alteration or repair as often as may be necessary, and shall see that all work for plumbing, drainage or ventilation is done in accordance with the provisions of these regulations, and shall collect all fees due said department.

PROPER BOOKS TO BE KEPT.

Sec. 8. The said Plumbing Inspector shall keep in proper books provided for that purpose a register of all transactions of said department, which said books shall be open to the inspection of the Mayor and the Comptroller and the members of the City Council at all times.

FEES.

Sec. 9. The Plumbing Inspector shall collect the following fees for all permits granted :

For each application for a permit in a new building or for alteration of existing plumbing, as follows :

When the estimated cost does not exceed $100 the fee shall be	$0.50
Over $100 and not exceeding $300 the fee shall be	1.00
Over $300 and not exceeding $800 the fee shall be	2.00
Over $800 and not exceeding $1,500 the fee shall be	2.50
Over $1,500 and not exceeding $2,500 the fee shall be	5.00

And for each $500 after the first $2500, the applicant shall pay an additional fee of 50 cents for each $500 of cost.

In case the owner, lessee or agent of any building in which plumbing has been placed prior to the passage of this ordinance, or after the plumbing of any building has been regularly inspected in pursuance of this ordinance, shall make application in writing to the Plumbing Inspector to have the same examined or inspected, it shall be the duty of the inspector, after the proper fee has been paid, to inspect said plumbing and furnish to such owner, lessee or agent a certificate showing the condition of the plumbing in such building, the fees for such inspection to be as follows :

In residences the inspection fee shall be $2.

In office, hotel or other public buildings of three stories or less, the fee shall be $3.

In office, hotel or other public buildings having more than three stories, the fee shall be $5.

In case the permit is refused for the reason that the proposed plumbing alteration or repair does not comply with the ordinances of the city the fee paid shall not be refunded, and in case changes are made in the proposed plumbing alteration or repairs so as to conform to the ordinances of the city only the one fee shall be collected. All of said fees shall be paid at the time the application for the permit is filed. All of said fees shall be turned into the treasury of said city.

INSPECTOR TO KEEP ACCOUNT OF FEES PAID.

Sec. 10. Said Plumbing Inspector shall keep an accurate account of all fees paid and required to be paid to him, giving the name of the party paying the same, the date paid and the amount of the fees.

INSPECTOR TO MAKE WEEKLY ACCOUNT TO THE TREASURER.

Sec. 11. Said Plumbing Inspector shall, on the last day of each and every week, pay over to the City Treasurer all moneys collected by him, and shall take a receipt and duplicate receipt therefor, and shall deposit such duplicate receipt with the City Comptroller, and shall render a report under oath each month to the said Comptroller of all moneys received.

SHALL KEEP HIS OFFICE—WHERE.

Sec. 12. Said Plumbing Inspector shall keep his office at such place as shall be designated by the City Council, and shall attend there for the transaction of the business of his office.

SALARY.

Sec. 13. The salary of the Plumbing Inspector shall be $100 per month.

YEARLY ACCOUNTING.

Sec. 14. The said Inspector shall at the end of each year prepare and present to the City Council a report showing the receipts and expenditures and entire work of his department during the full previous year ; he shall at the same time send to the Comptroller a full and comprehensive statement of all matters pertaining to the department, together with an estimate in detail for the appropriations required by the department during the succeeding year.

(To be continued.)

Albert Heckert.

Albert Heckert died at his residence, 106 North Queen street, York, Pa , last Saturday morning at the age of nearly 66 years, the immediate cause of his death being paralysis. For over 40 years Mr. Heckert followed the occupation of a tinner, and with the progress of the times took up the plumbing business, being a member of the firm of Heckert Brothers, tinners and plumbers, 20 East Market street. He took an active interest in local affairs, was a member of the Fire Department, and served in the City Council Chamber. He is survived by a widow and seven children.

Henry Ott.

Henry Ott, the vice president and secretary of the Ahrens & Ott Mfg. Company, Louisville, Ky., died at his residence, 1409 East Broadway, October 9. Mr. Ott's death was due to lock jaw, induced by an injury sustained from a fall when running to catch a street car. He was born in Würtemberg, Germany, in 1843, and was brought to this country at the age of eight years. He learned the plumbing trade, and finally became a manufacturer of plumbers' supplies, being connected with the Ahrens & Ott Mfg. Company at the time of his death. He was connected with a number of fraternal orders, and was buried with Masonic honors at the Cave Hill Cemetery, the pallbearers being the trustees of the First German Methodist Church, of which he was a member.

Plumbers in Syracuse, N. Y.

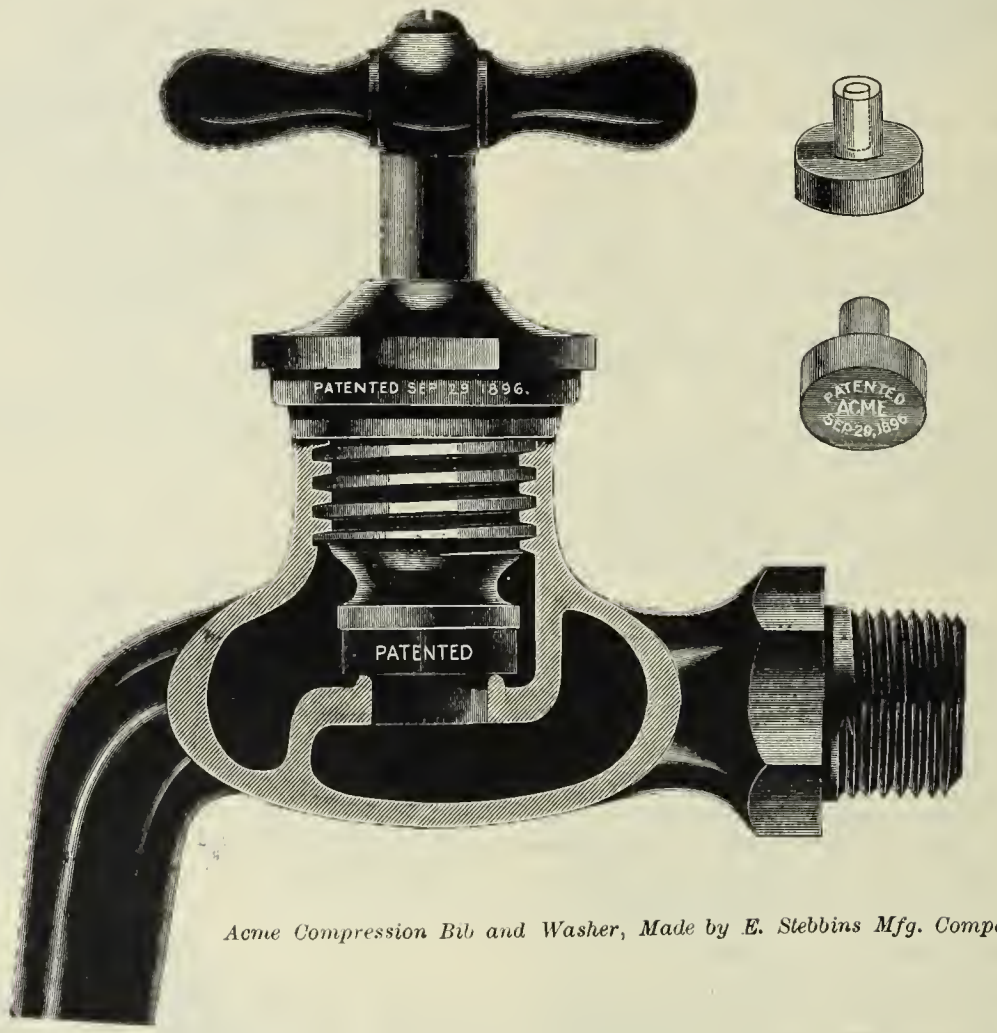
It is quite probable that some disagreeable competition would be removed it the plumbing laws of the State of New York were carried out in full, which is evidently not the case in Syracuse, for at a meeting of the Examining and Supervising Board of Plumbers and Plumbing of the city of Syracuse, N. Y., held October 5, 1897, the following resolution was duly adopted :

Resolved, That on and after January 1, 1898, all persons now conducting or intending to conduct the trade, business or calling of a plumber or of plumbing in the city of Syracuse, N. Y., must have passed the examination of the Examining and Supervising Board of Plumbers and Plumbing of the city of Syracuse, N. Y., and received a certificate of competency therefrom, as required by the New York State law.

In addition to the foregoing resolution, one member of the board called the attention of the board to the fact that out of 45 plumbers doing business in the city only 21 have fully complied with the State law. Twelve have received certificates of competency from the Plumbing Board, but have not registered with the Board of Health, and 12 more are doing business pending their examination. It will thus be seen that 24 plumbers are evading the law and making themselves liable to heavy fines.

Acme Compression Bib and Washer.

A new compression bib, known as the Acme, recently put on the market by the E. Stebbins Mfg. Company, Springfield, Mass., and attracting much attention among first-class plumbers, is illustrated herewith. The principal feature consists of a patent washer fitting closely into the spindle, but which cannot drop down owing to friction and length of the post. The washer is protected on top by a recess on the bottom disk of the spindle, and by moving easily within the socket gives the additional advantage of an adjustable seat. It is claimed that it never rattles under any circumstances, and is made of the best material for hot and cold water. Owing to the thickness and quality, it is claimed, it will outlast three or four times any ordinary washer of rubber or fiber. The bib is of a large full size pattern and the thread on all parts is of the United States standard. It is stated that it costs but a trifle more than the ordinary compression bib, and that prices and circulars will be forwarded to those who apply.



Acme Compression Bib and Washer, Made by E. Stebbins Mfg. Company.

New Jersey Plumbers' Convention.

A letter from John Campbell, 26 Lake street, Paterson, N. J., secretary of the New Jersey State Association of Master Plumbers, informs us that a convention of the Master Plumbers' Association of New Jersey will be held in Paterson, N. J., November 17, at Helvetia Hall on Van Houten street near Main. The committee in charge is John Campbell, chairman ; James McNab, Fred. Tattersall, Andrew Fielding and Thomas Wilson. The plumbers throughout the State, whether members of the association or not, are invited to attend in order to become acquainted with the object of the association and to associate themselves with the organization. The Paterson Association are preparing a "smoker" for the entertainment of the guests at the close of the convention.

Through what is claimed to be a misinterpretation of the Wisconsin plumbing law, the Board of Works of La Crosse have excluded the plumbing inspector and a master plumber to be appointed by the Mayor from the Plumbers' Examining Board, and in holding the plumbing examinations three of the oldest master plumbers in the city failed to secure a certificate of competency and have been denied licenses under which to operate their shops.

Changes in New York City Plumbing Regulations.

The Department of Buildings of New York City has printed in the City Record, in accordance with the law, and there is now in effect a set of rules and regulations for the plumbing, drainage, water supply and ventilation of buildings in New York City, which are practically the same as were printed in *The Metal Worker* of October 24, 1896. One change requires that water closets shall be set on a stone slab, and that sand or artificial stone will not be allowed. An important addition is as follows : "Wooden washtubs are prohibited. Cement or artificial stone tubs will be permitted, provided the same be made in the following manner—to wit, the cement or artificial stone to be 1 part good Portland cement to not more than 3 parts crushed or broken granite, gneiss or equally hard stone, broken to a size not larger than will go through a 1-inch ring, well tamped. Each tub to be branded with the manufacturer's name, and with the absolute mixture stamped on said tub, samples of which shall be filed and approved by this Department ; each compartment of the tub shall have a separate bottom outlet with a through and through fitting, and overflows shall be external to the tub."

American Society of Heating and Ventilating Engineers.

On Friday afternoon of this week a meeting of the Board of Management of the American Society of Heating and Ventilating Engineers was held in the office of President W. M. Mackay at 235 Water street, New York, when it was decided to hold the annual meeting of the Society on January 25, 26 and 27, 1898, in the rooms of the Society of Mechanical Engineers at 12 West Thirty-first street, New York, and arrangements to that effect are being made. At the meeting letters were read from ten of the leading members of the society announcing their intention to prepare a paper to be read at the annual meeting,

which already gives promise of being more interesting than any of the meetings hitherto held by the society.

NOTES.

The Vance Boiler Works, Geneva, N. Y., inform us that they are very busy on orders for the Vance Steam Heating Boilers, among which are a 40 horse-power boiler for the State Armory and an 80 horse-power boiler for the Waterloo Organ Company.

A Certificate of Excellence, awarded by the American Society of Florists at their convention at Providence, R. I., to the Scollay and Invincible Steam and Hot Water Heaters, hangs conspicuously on the walls of the office of John A. Scollay, 74 and 76 Myrtle avenue, Brooklyn, N. Y. The house is now busily engaged in filling orders that are coming in at this season.

A letter from Gunster & Forsyth, 327 Penn avenue, Scranton, Pa., informs us that the popularity of the Thompson S. P. Smoke Testing Machine is bringing in orders to such an extent that they are now making arrangements to greatly increase their producing facilities.

A plumber of Lewiston, Maine, has been brought before the courts of Auburn for doing plumbing work in Auburn without a license.

The City of Chelsea, Mass., will receive bids until October 26 for plumbing a ten-room graded school building on Washington avenue.

McLean & Keyes, Fred. Wild & Co. and Louis Gasser are prominent in the formation of a master plumbers' association at El Paso, Texas.

Mulligan & Schermerhorn have the contract for plumbing eight dwellings for Samuel O. Gleason, at Troy, N. Y.

William H. Day, who for some time has been foreman for J. H. & W. H. Riley, has bought the plumbing business of the late Frank S. Dibble, at Northampton, Mass., and will continue the business under the firm name of Day & Co.

Olcott & Heustis, Fonda, N. Y., have just completed the installation of a hot water heating plant in the residence of State Treasurer A. B Colvin, at Glens Falls, N. Y., using a No. 16 Sunray Heater and 21 Radiators. They are putting a similar system in the residence of R. M. Casler, at Fonda.

G. M. Conch, Hartford, Conn., has contracts for ten furnaces for houses which Nevels Bros. are building and two for Mr. Fried, and will use Howard Hot Air Furnaces.

Wm. Lumb & Co., Boston, Mass., under the charge of their Bar Harbor manager, William Pierce, are putting in a private sewer for several of the residents of West Gouldsboro.

An amendment has been offered to the ordinance recently introduced in the council of Cleveland, Ohio, for the addition of two plumbing inspectors to the present force. It provides that the inspectors be practical plumbers and not ordinary sanitary policemen. The ordinance was referred to a committee, which is also considering the amendment suggested.

James, Robert and Albert McClatchie have opened business on the old stand of Mr. Ruiter, at Sherbrooke, Quebec. They manufacture supplies for butter and cheese factories, Tinware, &c.

The Gorton & Lidgerwood Company, 96 Liberty street, New York City, inform us that one of their Gorton Side Feed Steam Heaters has been in use in the establishment of a large grocery firm in Newark, N. J, for the past 14 years, giving excellet service and with no expense beyond the original cost

The Noble, Johnson, Milne Company have leased the first floor and basement of the new Whittlesey Building on Cottage Row at Pittsfield, Mass, and intend to fit up a handsome showroom of Plumbing and Heating goods and to have a well equipped shop for doing first-class work promptly.

I. G. James, 48 Centre street, manager of the New York office of the Gurney Heater Mfg. Company, Boston, Mass., informs us that the James Steam Heating Company of Brooklyn will use a large size Bright Idea boiler for heating the Occidental Hotel, and that L. M. & J. T. White will use a large Bright Idea steam boiler for heating the Germania Theatre.

W. M. Murphy has been granted a license as a registered plumber at Norfolk, Va.

The McLean Air Pump & Machine Company have hung out a handsome new sign at their new quarters, 67 Centre street, New York City. They have done a large business in Bicycle Air Pumps during the past season, and make in addition to it a variety of Hand and Power Pumps adapted for plumbers' use, and are making a specialty of Air Pumps and Compressor Tanks. They recently filled an order for an Air Compressor and Tank to be driven by electric power.

L. E. Smith, Gloucester, Mass., has secured the contract to do the plumbing and to furnish the heating apparatus for the fine new school house at North Weymouth. It is about a $6000 job and speaks well for the firm. Mr. Smith has recently taken a Boston office in Tremont Temple, which is conducted by his son, Herbert C. Smith, sanitary architect.

E. T. Weymouth of 235 Water street, the New York representative of W. M. Tobin, Syracuse, N. Y., announces that he has secured the contract for heating the six-story addition to the store of Bloomingdale Brothers of New York City. They will use coils for radiation, and the heating will be done by means of exhaust and live steam. They will also install the necessary pumping apparatus to return the condensation to the boilers. Mr. Tobin is also heating the Hotel Gotham, using a Royal steam boiler and the Standard radiators.

An account of some primitive plumbing is given in the report of the State Board of Health of Vermont upon the causes of the outbreak of diphtheria in Bellows Falls. It criticises the systems of plumbing found in a number of dwellings where diphtheria has been, and suggests the immediate change of plumbing to conform with the regulations of the board. It is understood the board found a number of dwellings where the only method of flushing the closets was by water drawn from the faucets at the kitchen sinks and poured into the closets.

Fred. Groenewold, Napoleon, Ohio, was a visitor in New York this week consulting with W. M. Mackay on heating the Indian School at Mount Pleasant, Mich, in which boilers of 150 horse-power will be used and 10,000 feet of radiation, a portion of which will be of the direct indirect type. This work was secured by Mr. Groenewold in connection with Thomas Manion, of Manion Brothers of Toledo, Ohio.

The Cullen & Stock Heating & Ventilating Company, St. Louis, Mo., have filed articles of incorporation with a capital stock of $10,000, all paid. James J. Cullen holds 49 shares; C. A. Stock, 49 shares, and Phil. Stock, 2 shares.

"Steel Plate Fans" is the title of Catalogue No. 96, issued by B. F. Sturtevant Company of Boston. The steel plate fan is to-day recognized as the standard type for all general purposes of ventilation, heating and mechanical draft, where a large volume is desired without excessive speed or pressure. The catalogue before us is devoted exclusively to the illustration and description of fans of this type. It was evidently impossible to present all of the numerous special designs built by this company, but enough are shown to at least serve to suggest the possibilities of adaptation to special conditions. Their large number of specially designed engines of over 50 styles and sizes leaves them free to select in each case the one best suited to the requirements. Especial attention is called to the various forms of steel plate electric fans, which are constantly finding new adaptations as the use of electricity as a motive power is extended. Among the numerous useful tables pertaining to fans and their operation are several here presented for the first time. They are based upon the most recent investigations and calculations, and are as follows: Velocity, volume and horse-power required when air under a given pressure in ounces per square inch is allowed to escape into the atmosphere; velocity created when air under a given pressure in inches of water is allowed to escape into the atmosphere; hight of water column in inches corresponding to various pressures in ounces per square inch; pressures in ounces per square inch corresponding to various heads of water in inches; revolutions of fan wheel of given diameter necessary to maintain a given pressure over an area which is within the capacity of the fan; influence of the temperature of air upon the conditions of its movement; pressure and horse-power lost by friction of air in pipes; weights of air, vapor of water and saturated mixtures of air and vapor of different temperatures under the ordinary atmospheric pressure of 29.921 inches of mercury; the number of square inches of flue area required per 1000 cubic feet of contents for given velocity and air change; flue area required for the passage of a given volume of air at a given velocity. This table gives the volumes from 100 to 1000 cubic feet at speeds from 300 to 3100 feet per minute.

In the Federal Court at Chicago last week Judge Showalter handed down a decision in the case of Pilsbury *et al. vs.* H. R. Engle, which is of importance to other interests besides those engaged in the milling industry. Judge Showalter holds that because a certain line of goods is made in a certain place it does not give to the makers the right to a trade-mark in the name of that locality. The decision completely upsets the claims made by the Minneapolis millers, who asserted a vested right to the use of the word "Minneapolis" as a brand of flour.

SHEET METAL WORK.

PATTERN FOR ELBOW WITH THREE OPENINGS.

A correspondent writing from North Carolina wishes us to describe in *The Metal Worker* a method of developing the patterns for an elbow with three openings, the form being as shown in his sketch, which we reproduce in Fig. 1, in which A B C D E shows the elevation of the two arms, with vertical openings 11 inches in diameter at the bottom, joining into one horizontal opening 14 inches at the top, joining together at right angles, as shown in plan by F G H I J K.

In this connection it may be proper to remark that no matter how many pieces are contained in the elbow, or at what angle it is set in plan, the principles hereinafter shown are applicable to any case. Let A B C D E F G H in Fig. 2 be the side view of an elbow having three pieces

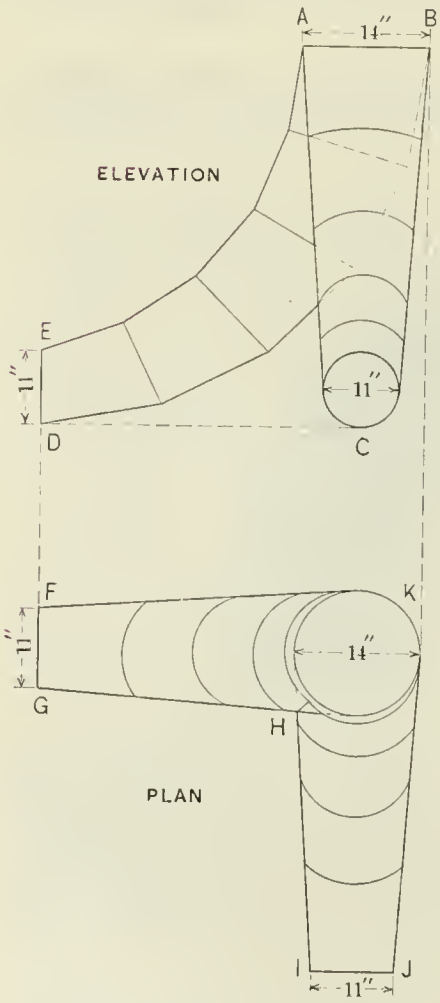


Fig. 1.—Reproduction of Sketch of Correspondent.

obtaining the patterns for the various sections to obtain profiles or sections on the miter lines A H, B G, C F and

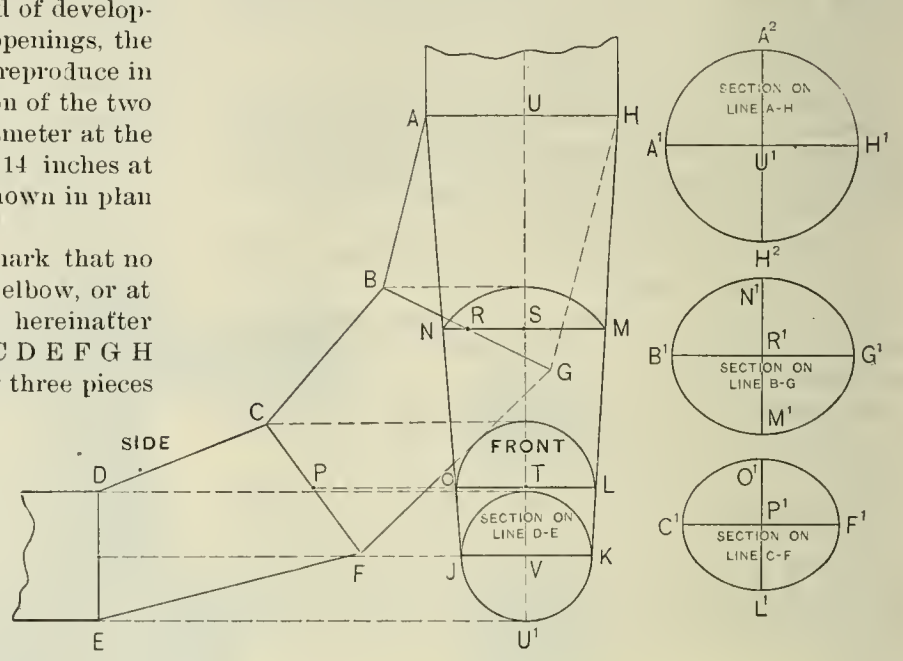

Fig. 2.—Elevation of Elbow, Showing Method of Obtaining Sections on Miter Lines.

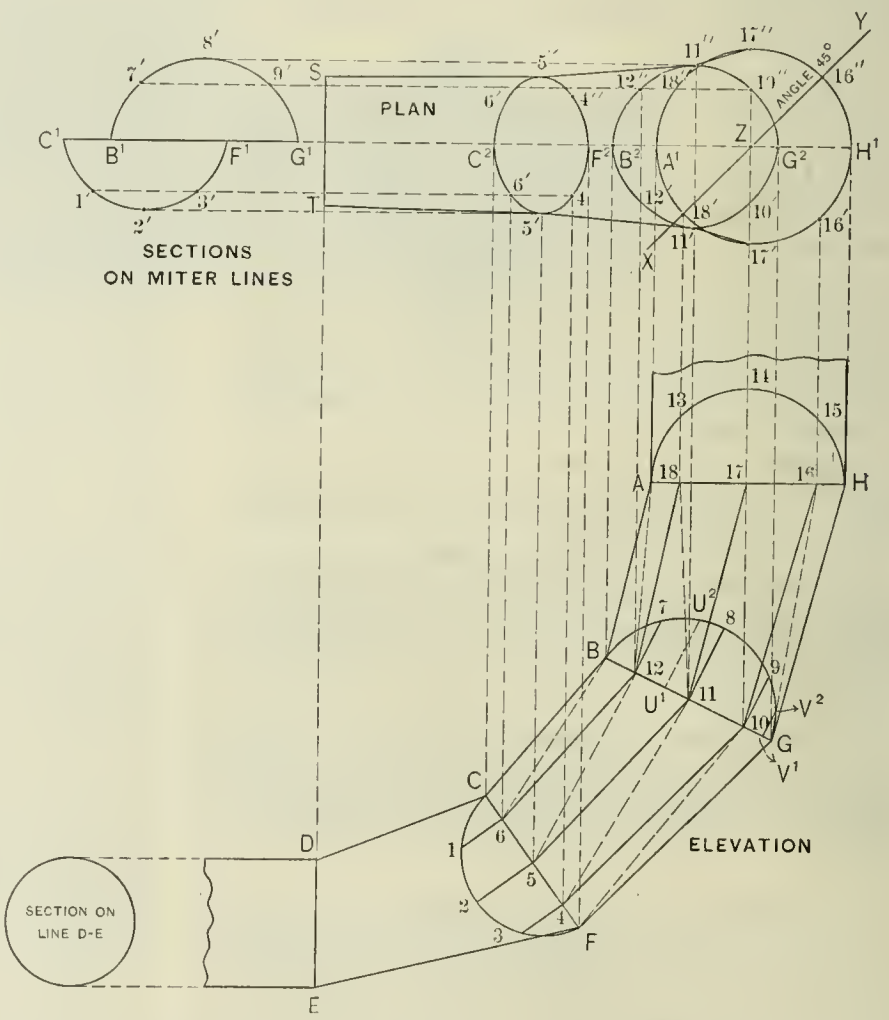

Fig 3.—Plan and Elevation, Showing Method of Obtaining Miter Lines in Plan.

PATTERN FOR ELBOW WITH THREE OPENINGS.

tapering, as shown, the front view being indicated by A J K H.

As the elbow is tapering, it will be necessary before D E, for which proceed as follows : Bisect the miter lines, as shown by the points U, R and P, respectively. Now at right angles to the center line U U¹ in front view, and

from the points R and P on the miter lines, draw lines intersecting the sides of the elbow in front, as shown by N M and O L. As the sections or profiles through C F and B G will be ellipses, the lengths and widths of which are given, construct them as follows : Draw any horizontal line, C^1 F^1, equal in length to C F in side view ; bisect C^1 F^1 by P^1; through P^1 at right angles to C^1 F^1 draw the line O^1 L^1, equal in length to O L in front view, making T O and T L in front view equal to P^1 O^1 and P^1 L^1, respectively. Through the points C^1 O^1 F^1 L^1 draw an ellipse by any method most convenient, which will be the section on the miter line C F in side view. In the same manner draw any horizontal line, B^1 G^1, equal in length to the miter line B G ; bisect B^1 G^1 by R^1, and through R^1 draw a line at right angles to B^1 G^1, making R^1 N^1 and R^1 M^1 equal to S N and S M in front view, respectively. Draw an ellipse by any convenient method through the points N^1 B^1 M^1 G^1, which will represent the section on the miter line B G. The section on the line A H at the top will be a true circle, whose diameter is equal to A H, the section being shown by A^2 A^1 H^2 H^1. The section on the line D E at the bottom is also a true circle, shown by T J U^1 K.

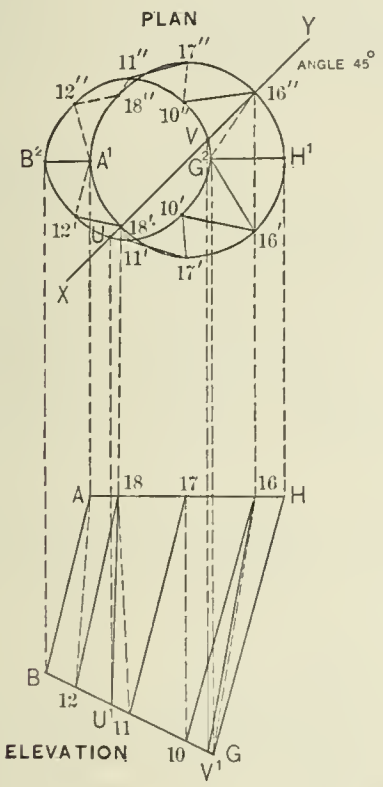

Fig. 4 —Elevation of A B G H, *Showing Triangulation*

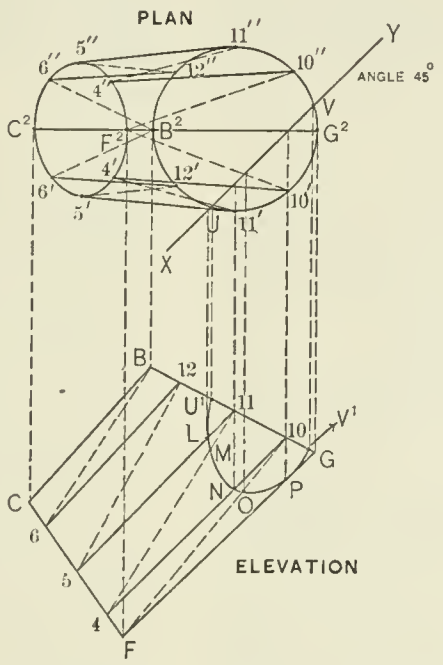

Fig. 5.—Elevation of B C F G, *Showing Triangulation.*

small figures 13, 14, and 15. At right angles to A H and from these points draw lines intersecting the miter line A H at 16, 17 and 18. Now draw solid lines from 6 to 12, 5 to 11 and 4 to 10, also from 12 to 18, 11 to 17 and 10 to 16, and dotted lines from 6 to B, 5 to 12, 4 to 11 and F to 10, also from 12 to A, 11 to 18, 10 to 17 and G to 16. Then will these solid and dotted lines show the bases, and the half profiles will show the hights from which to construct the several sections. Now in its proper position above the line A H draw the plan view of the top of the elbow, as shown by A^2 17′ H^1 17″, the circle being struck from the center point Z. Through the center point Z and parallel to A H draw the line C^1 H^1, then through the center point Z, at an angle of 45 degrees, draw the miter line or line of joint X Y, upon which the two branches of the elbow join at right angles, one branch only being necessary. Should

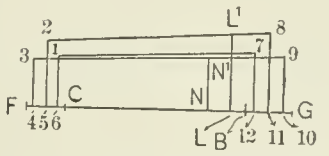

Fig. 6.—Diagrams of Sections on Solid Lines in B C F G *of Fig.* 3.

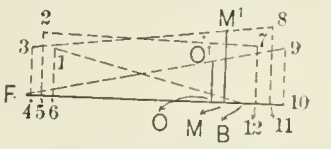

Fig. 7 —Diagrams of Sections on Dotted Lines in B C F G *of Fig.* 3.

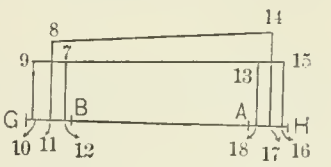

Fig. 8 —Diagrams of Sections on Solid Lines in A B G H *of Fig.* 3.

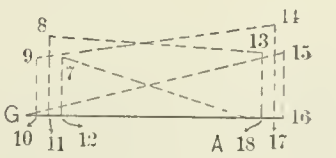

Fig. 9.—Diagrams of Sections on Dotted Lines in A B G H *of Fig.* 3.

PATTERN FOR ELBOW WITH THREE OPENINGS.

It will now be necessary to obtain the plan or horizontal view of the sections, showing where they will intersect the line of the joint X Y of Fig. 3. To obtain these miter lines in plan proceed as follows : Let A B C D E F G H in Fig. 3 be a reproduction of the same lettered figure in Fig. 2. Draw the miter lines D E, C F, B G and A H of Fig. 3. To the left of D E draw the profile or section, as shown. Take one-half of the section on the line C F, shown by C^1 F^1 L^1 in Fig. 2, and place it as shown by C 2 F on the line C F in Fig. 3. In the same manner take one-half of the section on the line B G, shown by B^1 N^1 G^1 in Fig. 2, and place it as shown by B 8 G in Fig. 3. The section on the line A H being a true circle, describe the semicircle A 14 H. Now divide the half profile C 2 F into equal spaces, as shown by the small figures 1 2 3. At right angles to C F and through the small figures on the profile C 2 F draw lines intersecting the line C F at 4, 5 and 6. In the same manner divide the half profile B 8 G into equal spaces, as shown by the small figures 7, 8 and 9. From these points and at right angles to B G draw lines intersecting B G at 10, 11 and 12. In similar manner divide the semicircle A 14 H, as shown by the however, the angle between the two elbows be other than a right angle in plan then the line X Y would have to be so drawn as to bisect that angle. To draw the plan view of the miter B G, take a tracing of the profile B 8 G and place it with the small figures on same on the center line C^1 H^1 in plan, as shown by B^1 8′ G^1. Now parallel to the center line C^1 H^1 and through the small figures 7′, 8′ and 9′ in the profile B^1 8′ G^1 draw lines, which intersect with lines drawn at right angles to the center line C^1 H^1 in plan from corresponding points 12, 11 and 10 on the miter line B G in elevation. Trace a line through points thus obtained, as shown by B^2 11″ G^2, which will show one half the miter line in plan ; trace the other half opposite with the various points on same, as shown by B^2, 12′, 11′, 10′, C^2, which completes the full miter line in plan.

In the same manner obtain the miter line in plan on the line C F in elevation. Take a tracing of the half profile in elevation C 2 F, and place it as shown by C^1 2 F^1 in plan. Parallel to the center line C^1 H^1 draw lines from the points 1′, 2′, 3′ in this profile, which intersect with lines drawn at right angles to the center line in plan from corresponding points in C F of the elevation, as shown by F^1, 4′,

5′, 6′, C² in plan. Trace a line through these points of intersections, as shown by C² 5′ F², which will represent one-half the miter line. Trace the other half opposite, as shown by C² 6″ 5″ 4″ F². Draw a line from 17″ to 11″, 11″ to 5″ and from 17′ to 11′ and 11′ to 5′. Now extend the line D E in elevation, as shown, and take one-half of D E and place it on either side of the center line in plan, as shown by S T. Then draw a line from 5″ to S and from 5′ to T, which completes the plan view of one branch of the elbow.

Having obtained the miter lines in plan on the various joints of the pieced elbow in elevation, it will now be necessary to obtain the elevation of the line of joint X Y in plan, upon which the two branches of the elbow are united. To do this proceed as follows : By referring to the plan it will be noticed that the line X Y cuts the section on the line A H in elevation at points 18′ and 16″, and cuts the section on B G in elevation at points between 10″ and G² on one side and 11′ and 12′ on the other. To avoid a confusion of lines, each piece of the elbow has been transferred separately. Thus in Fig. 4 A B G H, the section above same, and the miter line X Y are a reproduction of similar parts in Fig. 3. As B connects to A, 12 to 18, 11 to 17, 10 to 16 and G to H in elevation in Fig. 4, then in like manner connect similar letters and figures in plan, as B² to A¹, 12′ to 18′, 11′ to 17′, 10′ to 16′, G² to H¹, 16″ to 10″, 17″ to 11″ and 18″ to 12″. Now connect dotted lines in elevation, as 12 to A, shown in plan by 12′ to A¹, and A¹ to 12″; connect 11 to 18 in elevation, shown in plan by 11′ to 18′, and 11″ to 18″, and so on until all the dotted lines in plan and elevation have been drawn. Now wherever the line of joint X Y cuts these solid or dotted lines in plan perpendicular lines will be dropped intersecting similar dotted or solid lines in elevation, thus giving the line of joint in elevation. In this case, however, the line of joint does not pass any of the solid or dotted lines in plan, but only intersects the section of the top of the elbow at 16″ and 18′, and the miter line in plan on B G in elevation at V and U.

Now at right angles to A H in elevation and from points of intersections 16″ and 18′ drop lines which will intersect the points 16 and 18 on the line A H in elevation. In similar manner, at right angles to A H and from points of intersections V and U on the miter line in plan drop lines intersecting the miter line B G in elevation at V¹ and U¹. Draw a line, as shown, from V¹ to 16 and from U¹ to 18. Then will 18 U¹ V¹ 16 be that portion of the elevation which is to be cut from A B G H. For the miter line in elevation occurring in the elbow piece B G C F in Fig. 3 proceed in the same manner as in connection with Fig. 4. Let B G F C with its various solid and dotted lines, the plan views of the two sections on B G and C F in elevation, with their various figures plan in Fig. 5, be a reproduction of similar parts in Fig. 3. As C connects to B, 6 to 12, 8 to 11, &c , in Fig. 5, then connect similar points in the plan, as C² to B², 6′ to 12′, 5′ to 11′, &c., until all of the solid lines have been connected in plan to correspond with those in elevation. Now from the intersections between the solid and dotted lines in plan and the line of joint X Y drop lines at right angles to C² G² in plan until they intersect solid and dotted lines in elevation of similar numbers. Thus from the point V in plan draw a line intersecting the miter line B G in elevation at V¹; from the point of intersection on F² G² in plan intersect F G in elevation at P; from the point of intersection on the dotted line F² 10′ in plan intersect F 10 in elevation at O, and in similar manner from the points of intersection on the lines 4′ 10′, 4′ 11′, 5′ 11′ and U in plan intersect similar lines in elevation 4 10, 4 11, 5 11 and the miter line B G at N, M, L and U′, respectively. Trace a line through points of intersections thus obtained, as shown by U¹ L M N O P V¹, which represent the elevation of the line of joint X Y in plan.

The next step is to construct diagrams of sections on solid and dotted lines in elevation in Fig. 3. To do this proceed as follows: Draw any horizontal line in Fig. 6, as F G, equal in length to F G in Fig. 3. Now take the various lengths of the solid lines 4 10, 5 11, 6 12 and C B of Fig. 3 and place them as shown by 4 10, 5 11, 6 12 and C B in Fig. 6. Now from the various points 4, 5 and 6 draw vertical lines, making 4 3, 5 2 and 6 1 equal to 4 3, 5 2 and 6 1, respectively, in the section C 2 F of Fig. 3. In the same manner draw vertical lines from the points 12, 11 and 10 in Fig. 6, making 10 9, 11 8 and 12 7 equal in hight to 10 9, 11 8 and 12 7, respectively, in section B 8 G of Fig. 3.

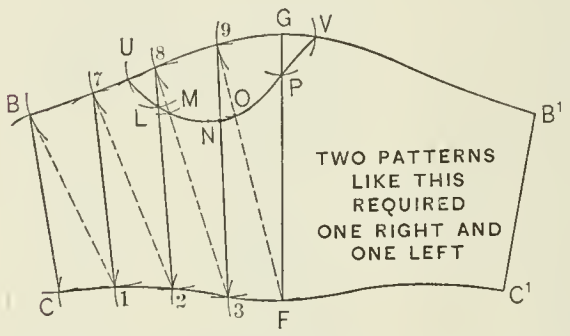

Fig. 10.—Pattern for Section of Elbow Shown by B C F G *of Fig. 3.*

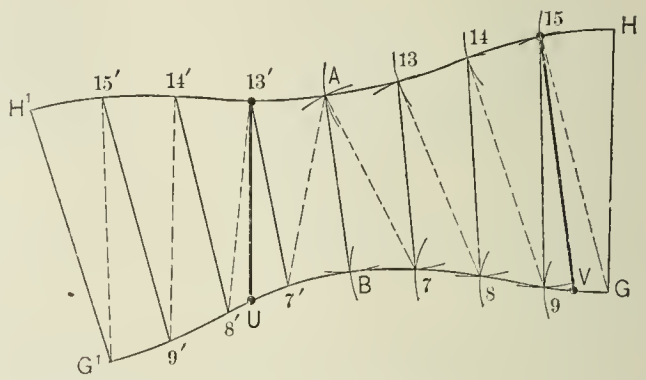

Fig 11.—Pattern for Section of Elbow Shown by A B G H *of Fig. 3*

PATTERN FOR ELBOW WITH THREE OPENINGS

Now connect the points in Fig. 6 by lines, as shown by 1 7, 3 9 and 2 8. Then will these diagrams represent the sections on solid lines in B C F G of Fig. 3. In the same manner construct the sections on the dotted lines. Draw any horizontal line, as F 10 in Fig. 7, making it equal in length to F 10 of Fig. 3. Now take the various lengths of the dotted lines 4 11, 5 12 and 6 B and place them as shown by 4 11, 5 12 and 6 B in Fig. 7. At right angles to F 10 and from the points 4, 5 and 6 draw lines, making 4 3, 5 2 and 6 1 equal to the hights in the section C 2 F of Fig. 3, as shown by 4 3, 5 2 and 6 1, respectively. In the same manner, from points 12, 11 and 10 in Fig. 7 and at right angles to F 10 draw lines, making 10 9, 11 8 and 12 7 equal in hight respectively to 10 9, 11 8 and 12 7 in the section B 8 G of Fig. 3. Now connect the various points in Fig. 7 by the lines B 1, 7 2, 8 3 and 9 F, which will represent the sections on the dotted lines in B C F G of Fig. 3. In the same manner obtain the sections on the solid and dotted lines in A B G H in elevation in Fig. 3, as shown in Figs. 8 and 9.

Having obtained all of these sections, the patterns will be developed as follows : For the pattern for that piece of the elbow shown by B C F G in Fig. 3 proceed as follows : Draw any vertical line, as F G in Fig. 10, equal in length to F G in Figs. 3 or 6. Now, with G of Fig. 10 as center, and G 9 in the section B 8 G, Fig. 3, as radius, describe the arc 9. Then with F of Fig. 10 as center, and F 9 of Fig. 7 as radius, describe an arc intersecting the arc 9. Then with F of Fig. 10 as center, and F 3 in the section C 2 F of Fig. 3 as radius, describe the arc 3. Then with 9 3 of Fig. 6 as radius, and 9 of Fig. 10 as center,

describe an arc intersecting the previous arc 3. Proceed in this manner, using alternately the spaces on the section B 8 G in Fig. 3, the upper lengths of the sections in Fig. 7, the spaces in the section C 2 F of Fig. 3 and the upper lengths of the sections in Fig. 6 until the last line, B C in Fig. 10, has been obtained. Trace a line through these points, and G B C F will be one-half the pattern for that piece of the elbow shown by B C F G in Fig. 3. Trace the other half of the pattern in Fig. 10 opposite the line G F, as shown by B^1 C^1. Then will B C F C^1 B^1 G be the full pattern. It will now be necessary to cut out from the pattern as much as is indicated by U N V to allow two pieces of this part of the elbow to miter on the line X Y in Figs. 3 or 5. To obtain this cut proceed as follows : From the various intersections of the miter line U^1 N V^1 with the solid and dotted lines in elevation, Fig. 5, take the various lengths 11 L, 11 M, 10 N, 10 O and G P, and place them upon similar base lines in Figs. 6 and 7, as shown. From the points thus obtained erect perpendiculars intersecting with the upper lines of the sections. Thus take the distance 11 L in Fig. 5 and place it, as shown, from 11 to L in Fig. 6. At right angles to 11 L and from L erect the perpendicular line intersecting the upper line of the section 2 8 at L^1. Now with 8 L^1 as radius, and 8 in the pattern of Fig. 10 as center, describe the arc shown at L. In similar manner take the distance shown from 11 to M in Fig. 5 on the line 11 4 and place it as shown by 11 to M on the line 11 4 of Fig. 7. At right angles to 11 4 and from M draw a line intersecting the line 8 3 at M^1. Now with 8 M^1 as radius, and 8 in the pattern of Fig. 10 as center, describe the arc M on the line 8 3. Proceed in similar manner for obtaining the points N, O and P in pattern. For the points U and V in pattern take the distances from 11 to U^1 and G to V^1 in Fig. 5, and place them, as shown, from 11 to U^1 and G to V^1 in Fig. 3. At right angles to B G and from points U^1 and V^1 draw lines intersecting the half profiles at U^2 and V^2. Now take the distances from 8 to U^2 and G to V^2 and place same, as shown, from 8 to U and G to V in pattern in Fig. 10 respectively. Trace a line through points U, L, M, N, O, P, V, which will be the desired miter line.

For the pattern for that part of the elbow shown by A B G H in Fig. 3 proceed in the same manner used in connection with the pattern in Fig. 10. Draw any vertical line, H G in Fig. 11, equal in length to H G in Figs. 3 or 4. Now with H in Fig. 11 as center, and H 15 in the section A 14 H in Fig. 3 as radius, describe the arc 15 in Fig. 11. Then with G 15 in Fig. 9 as radius, and G of Fig. 11 as center, describe an arc intersecting the previous arc 15. Now with G 9 of the half section B 8 G, Fig. 3, as radius, and G of Fig. 11 as center, describe the arc 9; then with 15 as center, and 15 9 of Fig. 8 as radius, describe an arc intersecting the arc 9 in pattern. Proceed in this manner, using alternately first the spaces in the half profile A 14 H of Fig. 3, then the lengths of the upper lines in the sections in Fig. 9, the spaces in the half profile B 8, G of Fig. 3, then the lengths in the sections of Fig. 8, until the line A B in pattern has been obtained. Trace a line through points thus obtained, as shown by H A B G in Fig. 11. Now place a duplicate of the pattern opposite the line A B, then will H^1 A H G B G^1 be the full pattern of that part of the elbow shown by A B G H of Fig. 3. It will now be necessary to cut away portions of the pattern in Fig. 11 to allow the mitering on the line of joint X Y of Fig. 4. To do so proceed as follows : Referring to the plan view in Fig. 4, it will be seen that the line of joint X Y cuts the upper section of the elbow at points 16′ and 18′; perpendicular lines dropped from these points cut the line A H in elevation at 18 and 16. Carry these points to the line A H in Fig. 3, as shown by 18 and 16. At right angles to A H and from points 18 and 16 draw lines intersecting the half profile A 14 H at 13 and 15. Mark off similar points in pattern, as shown by 13′ and 15 in Fig. 11. For the points U and V in pattern take similar measurements used in connection with the points U and V in pattern, Fig. 10. Take the distances shown from 8 to U^2 and from G to V^2 in the half profile B 8 G of Fig. 3, and place them, as shown, from 8′ to U and G to V respectively in Fig. 11. Then will 15 13′ U V be one-half the pattern for that portion shown in plan, Fig. 4, by 16″ V 18′ U, of which two patterns will be required. It should be understood that the line A B in Fig. 11 is shown by A^1 B^2 in plan, Fig. 4, and that the line G^2 H^1 in plan is shown by H G in Fig. 11, and the piece 13′ U V 15 in pattern is shown by 18′ U 12″ V 16″ 18″ in plan, Fig. 4. The pattern for the section C F E D, Fig. 3, will be obtained in similar manner as that in Figs. 10 and 11.

FLASHINGS.

J. C. McManus, Hartford, Conn., has just completed the metal balustrade and cornice, tin roofing and skylights on P. B. Smith's new block. He is also putting furnaces in the residences of W. C. Atwood and Judge Freeman and in two cottages for Watson Tryon.

The Penn Metal Ceiling & Roofing Company of Twenty-third and Hamilton streets, Philadelphia, Pa., have just established a branch office at 24 Pickering Building, Cincinnati, Ohio, under the able management of D. W. Pritchard, who has for many years been connected with the company, representing them both at home and abroad. Mr. Pritchard will give his exclusive attention to the sale of the Sagendorph Patent Metal Ceilings, Side Wall Finish and High Art Metal Relief Furnishings for interior decorative purposes in the territory tributary to Cincinnati, and other productions of the company which have been so long and favorably known to the trade.

The Dennison Rolling Mill Company, Dennison, Ohio, are getting ready to operate their plant. A new building 105 x 140 feet in area has been erected, which will contain a roll train, two Sheet mills with 40-inch rolls, one pair of cold rolls and two annealing furnaces. The output will consist of fine Sheet steel, cold rolled or pickled and cold rolled and stamping steel. A Black Plate mill will probably be added before long.

The plant of the Thompson Mfg. Company, Cleveland, Ohio, manufacturers of Corrugated Iron Roofing, was destroyed by fire on the night of October 18, with a loss to the owners, E. M. & C. M. Thompson, of about $25,000, partly covered by insurance. The Thompson Mfg. Company have operated the plant for 14 years and employed 25 men.

The Youngstown Iron & Steel Roofing Company, Youngstown, Ohio, manufacturers of Iron and Steel Roofing and Siding, are runing their factory to its utmost capacity, and have a very large amount of work on hand. This firm are making a specialty of their T. and C. Metal Lath and Buckeye Trough Floor for bridges and fire proofing purposes. and are in receipt of very large orders for these goods.

The stockholders of the Co-operative Sheet Mill, composed principally of former employees of the Scottdale Iron & Steel Company, Limited, at Scottdale, Pa., claim that $125,000 of the $150,000 of capital stock has been subscribed. The strikers state that they have taken $50,000 worth of the stock. It is the intention to put up a plant containing six sheet mills and a bar mill, but all arrangements have not yet been perfected for the building of the plant.

The Buffalo Corrugating Company, H. O. Wilson & Co., proprietors, 35 Washington street, Buffalo, N. Y., are equipping their factory with new and modern machinery for the production of a complete line of sheet metal goods in the way of Roofing, Siding, Stamped Steel Ceilings, Cornices, Skylight work, &c. The company state that their facilities will be such that in connection with the great railway advantages of Buffalo they will be in a position to make quick shipments and prompt deliveries to the trade, a feature which will be recognized and appreciated by those using their line of manufactured products. They are particularly prepared to make any kind of special work upon receipt of plans and specifications at reasonable prices. A circular which they have issued calls attention to the varied lines of goods manufactured, and to the fact that they employ skilled mechanics and guarantee their work.

A dilapidated pocketbook of the old-fashioned type in a plethoric state came in our mail recently, and on opening one end of it a check was found payable to any man finding a flaw in the work of the senders The check bears the name and address of Gara, McGinley & Co., 23 South Seventeenth street, Philadelphia, Pa., who make a specialty of Roofing and Architectural Sheet Metal work. Accompanying the purse is an addressed postal card and a letter stating that it is their custom in the fall to remind their customers that it is a good thing to look after their roofs. In a little circular, having on the front page the suggestion to "Do it right now to day," and on the back page a picture of a tinner at work on a roof, the assertion is made that more roofs are ruined by not making essential repairs than by hard weather. Their experience in the roofing business is reflected in the statement that they have roofed buildings from 12 feet square to those having 460,000 square feet, as was the case in the St. Louis, Mo., terminal train shed.

TIN PLATES.

A Shenango Valley Consolidation.

For some time negotiations have been under way by which the Shenango Valley Steel Company will take over the Neshannock Furnace, the New Castle Steel & Tin Plate Company and the recently organized Shenango Tin Plate Company. Arrangements have been completed by which the interests of these four companies will be consolidated, and the name retained will be Shenango Valley Steel Company, the capital stock being $1,500,000. Neshannock Furnace is one of the best equipped stacks in the Shenango Valley, and has a capacity of about 300 tons of iron per day. The plant of the Shenango Valley Steel Company is one of the most complete Bessemer plants in the country, having recently been extensively remodeled throughout. A bar mill is being added and the concern will be in the market as makers of sheet bars about January 1. The plant has a daily capacity of about 600 tons of billets. The plant of the New Castle Steel & Tin Plate Company, Incorporated, was originally built in 1892-93, and was put in operation in October, 1893. To this concern belongs the distinction of having one of the best equipped and the largest tin plate plant in the country. At present there are 20 hot mills, being a larger number than owned by any other individual tin plate concern. The plant has been very successful from the start, much of the success attained having been due to the administration of George Greer, president, and Charles Greer, secretary.

The Shenango Tin Plate Company have only recently been organized, but, as stated in these columns last week, the contracts for their buildings and most of their equip ment have already been placed. The order for the build ings has been given to the Shiffler Bridge Company of Pittsburgh, and that for the tin mill equipment to Mackintosh, Hemphill & Co. of that city. The mills will be driven by three twin and one single tandem compound condensing blowing mill engines, the contract for which has been placed with J. Wiedman Murray, manager of the Pittsburgh office for the Edward P. Allis Company, Milwaukee, Wis. The sizes of the steam cylinders in each of these engines are as follows : High pressure steam cylinder 25 inches in diameter, low pressure cylinder 50 inches in diameter, each 60-inch stroke. It is expected to have this plant ready for operation about April 1, 1898, although the work of construction may not be completed by that date, depending largely on the severity of the weather during the winter. This will undoubtedly be the largest individual tin plate plant ever built in this country or in the Old World.

The Neshannock Sheet and Tin Plate Company.

A third tin plate plant is likely to be added to the industries of New Castle, Pa. Application was made last week for a charter for the Neshannock Sheet & Tin Plate Company of New Castle by George W. Johnson, George W. Hartman, Charles H. Johnson, William K. Johnson and Wm. O. Kirkland. The company propose to convert the Arethusa Sheet Mills, at New Castle, which have been idle for some years, into a plant for the manufacture of black plate. Four mills will at first be built, but it is proposed to enlarge the works to an eight-mill plant in the near future. Black plate only will be turned out at the beginning, although it is the intention of the company to do their own tinning eventually. An addition to the present buildings is to be made for the cold roll and the pickling departments. It is expected that the plant will be ready for operation early in the coming year.

SCRAP.

At the present writing no less than 79 new Tin mills are either building or definitely projected for early erection. Of these there is a practical certainty that at least 65 will be in operation within six months from now, while the other 14 are more than likely to be finished by that time. Added to the 211 completed mills reported in our list on October 1, these additions would give the American industry a grand total of 290 mills. This means a capacity of considerably over seven million boxes a year. In addition, it is understood that quite a number of other Tin Plate enterprises are being considered, some of which are likely to materialize after the first of the year. The question is being asked by many in the trade : "Is not the building of new Tin Plate mills going to be overdone ?"

At the recent annual meeting of the Swansea Royal Metal Exchange, Swansea, Wales, Sir John Jones Jenkins, M.P., the president, in referring to the loss of trade to the United Kingdom brought about by the imposition of high tariffs in America, said that the Welsh Tin Plate industry had been affected to a greater extent than any other interest. Since 1895 the decrease in the shipment of Tin Plates to the United States had been very marked. In 1895 they had shipped 151,672 tons to the United States, but in 1897 only 41,000 tons. But they had increased their shipments to Batoum and St. Petersburg from 42,800 in 1895 to 50,039 tons in 1897. The increase to other Continental ports had also been satisfactory, having increased from 25,000 in 1895 to 43,000 in 1896, and to 53,000 in 1897. To the Straits Settlements they had sent none in 1895, but in 1896 they had sent 4000, and in 1897 12,000 tons. Although the decrease to the United States had been 44 per cent. from 1895 to 1896, and 51 per cent. in 1896 as compared with 1897, the increase to Russia and Continental ports had been 128 per cent. So they would see that their staple trade, although very unsatisfactory as regards the United States, had been encouraging in the increase of shipments to other countries. He wished that the improvement had been more rapid, in order to adjust the dislocation of trade brought about by the loss of such a large customer as the United States.

The officers of the new Shenango Tin Plate Company of New Castle, Pa., are Wm. Patterson, president ; John Stevenson, Jr., vice-president ; Wm. E. Reis, treasurer ; Rufus Patterson, secretary.

It is reported that some important additions and improvements are to be made in the plant of the Canonsburg Iron & Steel Company, Canonsburg, Pa., which will largely increase their output.

W. C. Brown, 36 La Salle street, Chicago, agent for the Reeves Iron Company, Canal Dover, Ohio, has issued an announcement that the company have resumed the operation of their Bar department, which had been shut down this entire year on account of unremunerative prices.

Work has been commenced on the erection of six additional hot mills at the Tin Plate plant of the Laughlin Nail Company, Martin's Ferry, Ohio.

The regular monthly statement of dutiable goods in the bonded warehouses of New York City shows that on September 30, 1897, 2,391,328 pounds of Tin Plate, valued at $53,575, were so held. On the corresponding date last year the amount was 4,617,188 pounds.

Great impetus has been given to the work of trade education at the Hampton Institute for Colored Youths, Hampton, Va., since the opening of the fine new Armstrong & Slater Trade School building there last fall. The management of the institute has been enabled to very materially widen and improve the character of the trade instruction since coming into possession of the facilities provided in the well equipped building. The attendance and the progress during the past season were very encouraging, and the trade school has now entered on its second year in its new quarters with a large number of scholars and excellent prospects. The theoretical work done in the trade school is supplemented by labor in the industrial shops of the institute, where the work is for purposes of production, the output going largely into use in the institute itself.

THE RETAIL STORE.

B. F. Guy & Co.

Every stove manufacturer or traveler who has visited Washington, D. C., within the past 25 years will bear evidence to the courtesy and the general good treatment received at the hands of B. F. Guy, senior member of B. F. Guy & Co., 1005 Pennsylvania avenue. Mr. Guy is to day the connecting link between the present stove generation and the generation before the war, and has had an honorable career in the stove and furnace business. Coming to Washington when a young man, in the year 1849, he clerked three years for a Mr. Woodward, a prominent merchant on Pennsylvania avenue in those days, and he was invited to become a partner in the year 1852. After a year's experience, not finding the partnership pleasant and satisfactory and all that it was represented to be, he took counsel and advice with a W. J. Sibley, a wealthy man then a resident of Washington. Mr. Sibley's advice was to secure an option on the business and to buy out Mr. Woodward's interest, which was done in 1855, Mr. Guy taking in as partner Mr. Johnson, a fellow clerk, the firm being known as Johnson, Guy & Co., the company being his adviser, Mr. Sibley. This partnership lasted only one year, being succeeded by Sibley & Guy, Mr. Johnson selling out his interest and leaving Washington. The firm of Sibley & Guy continued together from 1855 until 1868, being the largest and doing the most profitable business during those stirring years through the war.

B. F. GUY.

To convey to the present generation an idea of the magnitude of their business, Mr. Guy related to the writer that during the four years of the war the firm did a business of $1,600,000, an average of $400,000 a year, and, as stated by Mr. Guy, nothing could be bought but what could be sold—a great contrast to the conservative methods adopted during the present business depression. The firm were very successful, and both members having obtained a competence retired from the business in 1868, being succeeded by Mr. Simpson, who had been their bookkeeper for a number of years. Mr. Guy retired to the outskirts of the city, and spent a quiet life until the year 1880, when, being still a young man and restless for business, he bought back an interest in the old stand, and the firm were continued as Simpson & Guy until 1885, being then succeeded by B. F. Guy & Co., who have been continued down to the present time.

During this long period of years Mr. Guy has never moved, and he has seen many changes. He has seen a small city grow to the most magnificent city in the Union, and the capital of the greatest country on earth. He has bought particularly in all those years from Fuller, Warren & Co. of Troy, N. Y., being their recognized agent at Washington. High priced goods have always found a market in his salesroom, and any first-class goods, regardless of where they were manufactured, have always been taken hold of by the firm. Their methods have always been progressive and honorable, and it is a remarkable fact that during these long years of business Mr. Guy, whose portrait is presented herewith, has never failed to pay at maturity all of his obligations. The stove trade bears witness to his kindness, courtesy and fair treatment to all, and all wish him many continued years of business and prosperity at the old stand.

L. & G. Enameled Wares.

A new catalogue and price-list of 130 pages issued by the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, relates to their Agate nickelsteel, Crystal steel, Peerless, blue and white and white enameled wares. The present edition of revised prices annuls all previous lists issued by the firm. It contains over 300 illustrations of enameled articles, many of which are new goods recently added to their assortment. Special attention is called to the patented Agate nickel-steel ware, and certificates from leading analytical chemists are presented testifying to the absence of any poisonous or deleterious substances in its coating. The Peerless ware is described as made of sheet steel covered with mottled gray enamel; the Crystal steel ware is of a grayish, color slightly tinged with blue, presenting a wave-like appearance, and the Blue and White ware is also of sheet steel coated with pure white porcelain on the inside and bright blue enamel on the outside. At the end of the catalogue is a handy alphabetical index. A tasteful little pamphlet, entitled "Kitchen Utensils," devoted to a description of the merits of Agate ware, and containing an extract from the *American Journal of Health*, accompanies the book.

MEMORANDA.

Allen Brothers, hardware merchants, at Snohomish, Wash., have opened a store at Skaguay, Alaska, where they are handling Hardware, Stoves, Tinware, &c., making a specialty of outfits for Yukoners.

A large line of Refrigerating Machinery, manufactured by the Newburg Ice Machine & Engine Company, Newburg, N. Y., is thoroughly described in a catalogue just received. These machines are made in capacities ranging from 10 to 50 pounds of ice per day for family use, up to the largest sizes intended for those industries requiring great artificial refrigeration.

Keen & Hagerty, Baltimore, Md., manufacturers of Tinware, Galvanized and Enameled Ware, have moved their offices and salesrooms to the large warehouse building, 16 West Baltimore street, in their city. This gives them commodious quarters in the heart of the city and on the principal street, and besides proving a convenience to them will also be an advantage which their customers cannot fail to appreciate. The rapid growth of their business is already creating a pressure upon the factory floor space, and the present removal of a prominent department will afford them some relief.

TRADE REPORT.

METAL MARKET.

Pig Tin.—There have been fairly large arrivals, via London for the most part, but these, as well as previous receipts this month, were well taken care of between deliveries on prior sales to consumers and replacing of stocks by dealers. Wholesale prices have moved up slowly but steadily, without the aid of anything in the nature of purely local speculative assistance, and they remain quite firm. The consumption has been, apparently, well up to the new supply, but whether it will continue to take up what London may supply, directly or otherwise, is conjectural. Jobbers' prices, also remain firm. Straits Pig in small lots from store is quoted at 14¾c. per lb.

Copper.—The market is in somewhat uncertain position at the moment. Home consumers are buying very indifferently, and export trade orders are not only below the late average in point of volume, but generally restricted at a lower level of prices. In other words, buyers' and sellers' ideas are at least ¼c. per lb. apart where business on a large scale is concerned. In a smaller way prices remain about at the level of a week ago. Small lots of Lake Ingot from stock are quoted at 12¼c. per lb., and Ansonia Grade Casting at 11¼c.

John Stanton reports the Copper production in the United States and of the foreign reporting mines and United States exports as follows, in gross tons of 2240 pounds :

	Reporting mines.	Outside sources.	Total U. S. product.	Product foreign mines.	U. S. exports
First half 1895....	70,612	9,100	79,712	42,484	34,215
Second half 1895..	84,885	6,600	91,485	43,674	30,507
Total 1895.....	155,497	15,700	171,197	86,178	64,722
First half 1896....	94,180	7,200	101,380	42,255	58,216
Second half 1896..	95,314	7,200	102,514	43,941	67,287
Total 1896.....	199,494	14,400	203,894	86,196	125,503
First half 1897....	103,651	5,000	108,651	44,263	64,870
January, 1897.....	16,937	700	17,637	6,595	9,651
February.....	16,119	700	16,819	7,241	8,856
March.....	17,583	700	18,283	8,358	11,232
April.	16,554	900	17,454	7,318	10,279
May.....	17,805	1,000	18,805	7,116	12,175
June.....	18,653	1,000	19,653	7,635	12,677
July.....	14,244	1,100	15,344	7,327	13,728
August.....	16,309	1,100	17,409	6,963	10,971
September.....	16,343	1,100	17,443	7,541	10,980

Sheet Copper.—There is no material change to note in this department. The demand, while fairly liberal, is irregular, and in the aggregate is smaller in volume than in recent weeks. The mills are busy on orders, most of which, however, were placed some time ago. They hold comparatively few orders for delivery after the end of this year. Nor are they eager to book for deferred deliveries at the prices now ruling. Prices are referred to as firmer. For spot and early delivery 15c. per lb., basis, is a fair quotation for Sheet Copper in small lots from stock.

Pig Lead.—The weakness that had developed in the market at the date of our last review has become more pronounced. Heavy selling pressure has, in fact, been a conspicuous feature. Without counteracting buying for consumption, this had sufficient weight to carry wholesale prices down 2-5c. here and in the primary markets. On the break about 3000 tons changed hands, chiefly for near future delivery. Retail business has been dull. Dealers have reduced prices on small lots of American Pig to 4.35c. to 4½c. per lb. Bar Lead in small lots is quoted at 5c.

St. Louis advices are as follows: The bottom has completely dropped out of the Pig Lead market. The speculators have unloaded and large quantities were thrown on the market at prices ranging from 4.10c. down to 3.70c. The market is feverish, and producers are uncertain what the outcome will be. Consumers are holding off, anticipating a still lower range of prices, and there is hardly any doubt but what they will be accommodated.

Spelter.—A moderate business only has taken place here, and the demand is mostly of very indifferent character, with buyers seemingly satisfied to take a few carloads at a time. Good brands, in a retail way, rule at about 4.65c. to 4.75c. per lb. for Western.

St. Louis advices indicate an unchanged market there, with a fair amount of Spelter moving at the rates current a week ago. Buyers and sellers seem well satisfied with the present figure.

Sheet Zinc.—A quiet market is reported. The consumptive demand is of a very ordinary description, and prices show no variation. Jobbers quote 600-lb. cask lots at 5⅝c. to 5¾c. per lb. and smaller quantities at 6⅛c. to 6¼c.

Antimony.—Business has been only fair and prices are barely steady. Retail prices are reported on the basis of 8¼c. to 8½c. for Cookson's, 7¾c. for Hallett's and 7⅛c. to 7¼c. for Japanese in small parcels from store.

Nickel.—The market is steady, with sellers quoting 36c. to 38c. per lb. for small quantities.

Aluminum.—The demand is reported as fairly large. Present prices are as follows : No. 1 Aluminum, guaranteed over 99 per cent. pure, in Rolling Ingots, is quoted in small lots at 40c. per lb., 100 lb. lots, 36c.; No. 2 Ingot, guaranteed over 90 per cent. pure, is quoted in small lots at 34c. per lb., 100 lb. lots, 33c., and special Casting Alloy, containing over 80 per cent. pure Aluminum, used in place of Brass, 35c. per lb., 100 lb. lots, 30c. The Pittsburgh Reduction Company have withdrawn their quotation of 30c. per lb. for Scrap Zinc. The market value of Scrap is now not over 15c. per lb.

Tin Plate.—The week has been a decidedly quiet one in the Tin Plate market. Business was merely of fair volume. The close of the canning season has shut off the demand from that quarter and other large consumers are very indifferent. Were the demand at the present time at all active the market would be undoubtedly much stronger, as spot stocks are decidedly scarce. The difficulty experienced by the mills in getting Billets and Tin Plate Bars is more pronounced than ever, owing to the temporary stoppage of two of the producing plants, one on account of failure of water supply, and the other because of a strike. Consequently the Tin Plate makers are getting much behind in their deliveries on contracts. This causes little inconvenience to jobbers and consumers, however, in the present apathetic condition of the demand. Some weakness is noted in the market, especially in prices for future deliveries. In this line extremely low offers of American Plates are said to have been made here during the week. Jobbing business has been pretty active, except in Roofing Ternes, which sell very slowly. Jobbers' prices show little change, except in American Charcoal Brights for spot delivery, which are a little stronger. Quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows : American Coke Tins IC, 108 lbs., 14 x 20, Bessemer Steel, $3.50 to $3.60 ; do., 100 lbs., $3.40 to $3.50 ; do , 95 lbs., $3.35 to $3.45 ; do., 90 lbs., $3.30 to $3.40 ; American Charcoal Brights, Melyn grade, IC, 14 x 20, $4.75 ; Allaway grade, IC, 14 x 20, $4.25 ; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates are moving in a moderate way only. Purchases are mainly by packers of export goods. Prices are largely nominal.

Cleveland advices are as follows : Previous to the announcement of a large increase in Tin Plate capacity next year much work for 1898 was placed on the books. Mills are getting a premium of about 5c. a box on early deliveries.

A special London cable dispatch of October 20, 1897, reports on the British Tin Plate market as follows : "The Tin Plate market has been quiet, and prices are barely steady on the basis of 9s. 6d., f.o.b. Swansea, for ordinary 14 x 20 Bessemer Cokes."

Sheet Iron —The demand from mills continues quite heavy and for the same reasons which prevail among the Tin Plate workers—scarcity of Billets and Bars—there is still considerable difficulty in getting Black Sheets for prompt shipment. The prices recently established on Sheets are reported to be well maintained. Locally the demand is fairly liberal. Jobbers' prices are unchanged from the rates reported for the past few weeks—namely, 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron, 2.65c. to 2.70c. for No. 27 R. G. cleaned and 75 and 10 and 5 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: Business continues to be quite good and orders were fully as large last week as they were the week previous. Store business in small lots was especially good. Quite a few mills are asking higher prices. Small lots from stock are selling at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—There is quite an active home demand, especially for Scrap Iron, and prices hold firm. Dealers are paying about the following prices for New York City delivery:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¼c.
Light Brass	per lb. 4¼c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 2¾c.
Zinc	per lb. 2 c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4¼c.
Wrought Scrap Iron, per gross ton	$10.00 to $10 50
Heavy Cast Scrap, per gross ton	$9.00 to 9.50
Stove Plate Scrap, per gross ton	5.50
Burnt Iron, per gross ton	4.50

THE IRON MARKET.

The Iron market, in nearly all its branches, is undeniably considerably quieter. To a very great extent this is due to the fact that both sellers and buyers are committed for the balance of the year, and that in many lines the former are unwilling or unable to name figures for 1898 delivery. As a matter of fact, many in the trade hail the present halt in activity as a desirable development, since it puts an end for the present to any danger of an excited and unsound inflation of prices. Buyers, particularly of Pig Iron and Steel, claim that what figures are named for 1898 are altogether too high, judged from the standard of values of finished products. The latter, it is true, have hardened and have advanced a little, but that advance is not in proportion to the rise in Billets, for instance. They claim that it will pay them to hold off, particularly since the dull season of the year for the rolling mills is coming on.

It looks as though there might be a stand off for some weeks to come, during which the temper of both sides will be tested. Usually the producer has been at a disadvantage in deadlocks of this kind, but the fact that the best equipped and most active works are full of orders for months to come puts them in a position more than usually favorable. Prices thus far made are far from tempting to works who have been long idle, so that it will take a fresh rise before the ranks of competitors are swelled. The immediate future is assured, and it seems almost too early to worry over the first or second quarter of 1898.

Bessemer Pig Iron has been very quiet, while in Steel there is a momentary scarcity, caused by the stoppage of two works, which shows how close the Central West is working up to full capacity. In Foundry Iron, a slightly disturbing element has appeared lately in the form of offerings of Warrants at a concession. Some of these lots have found takers. The makers themselves are quietly maintaining their position.

Pig Iron.—In the New York market, buying has been limited in character. The larger consumers in the district are covered for some time to come. Some Warrants have been placed in this market, which were sold by a bank. The quantity involved was not large. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

Reports in respect to the Philadelphia Pig Iron market are not all of the same character this week. Some are strong, some hesitating, some less confident than during the earlier portion of the month. Taking a broad view of the situation, however, it would seem that prices are steady to firm, although there is more Iron for sale than there was a week or two ago. Warrant Iron is offered rather freely, but consumers do not take to it very kindly unless at a pretty wide difference in prices. General quotations for seaboard deliveries are about as follows, with the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.50; No. 2 X Foundry, $11.25 to $11.75; No. 2 Plain, $10.75 to $11.

The furnaces in the Chicago district are all very firm in their views and are making no concessions. Prices on immediate business are firm, and on deliveries the early part of next year an advance of 25c. to 50c. per ton on some grades is named. The Southern furnaces are all asking that much more, and have refused business in the last week where the buyer did not want to pay the additional price asked. The foundries in the Chicago territory are getting busier all the time, and with the exception of the Architectural Iron and the small jobbing foundries are doing more business than they have for a long time before. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

The Pittsburgh Pig Iron market is very quiet, hardly enough Iron changing hands to establish a price. In spite of this prices are strong and there are no indications present of a slump. Foundry Irons are dull. We quote as follows, f.o.b. Pittsburgh: No. 1 Foundry, $10.50 to $10.75; No. 2 Foundry, $10 to $10.25; No. 3, $9.50 to $9.75; Bessemer, $10.40 to $10.65.

In Cincinnati the tone of the market has been quiet and firm, with energies directed more toward expediting deliveries than in securing new orders. The run of new business has been normal. The tonnage has been moderate, built up mainly of small orders, though with a sprinkle of 500 to 1000 ton lots. The outlook for the coming few weeks is a healthy one, and general quietude is expected. Not before December 1 is it expected that there will be another active buying movement. Northern Irons have been fairly active, and at about previous quotations are fairly strong. Prices on Southern Pig are nominally unchanged. Furnaces are, in the main, holding firmly to the maximum quotations. There is, however, a good sprinkle of speculative holdings which are being offered at inside figures, and this makes the market a little irregular. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

CHICAGO REPORT.

Scrap.—Old material is being sold as fast as it can be obtained from sources of supply. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.50	....
Machinery Cast	7.00	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c.	2.50	....
Old Boilers—whole (Iron)	3.00	....
Old Boilers (Iron)—cut in single Sheets and Rings	7.00	....
Old Gas Pipe and Boiler Tubes	6.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	9.50	....
Copper Wire and Heavy	....	10 c.
Copper Bottoms	....	9 c.
Copper Clips	....	9¾c.
Red Brass	....	8 c.
Yellow Brass	....	7 c.
Light Brass	....	4 c.
Pipe Lead	....	3.60c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	¾c.

Anthracite.—Business is dull. The price on carload lots of 12 tons minimum is now as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill.	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8 60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

Frederick Haberman, of the Haberman Mfg. Company, is the regular Democratic nominee for Alderman of the Twenty-ninth District, New York City.

THE HARDWARE TRADE.

The business conditions have not materially changed during the past week. Trade moves along in good volume, for the most part at steady prices. The demand is, however, somewhat uneven, being interfered with to some extent in the South by apprehensions in regard to yellow fever, and in some parts of the West by the exceptional drought which has prevailed. The disturbing influence of these causes will, it is hoped, soon cease, when a quickening in the demand is anticipated. From other parts of the country reports are encouraging, and notwithstanding the fact that orders are somewhat spasmodic, being many and relatively large for a few days, and then falling off in number and size, the outlook continues very satisfactory. With the coming of cold weather, which has been unusually slow in its approach, there will undoubtedly be a marked increase in the call for winter goods, and both manufacturers and jobbers will probably be taxed to their utmost to meet the demand. It is not unlikely that the trade who have deferred purchasing too long will have to wait in some cases for the execution of their rush orders. There is little new to report in the matter of prices. In some lines there is a good deal of cutting, and manufacturers have not as yet seen their way clear to announce advances which on general principles should be made. There is some complaint about collections, but the financial condition is on the whole excellent.

Advices from Chicago.—No material change has taken place in the condition of the Hardware trade during the last week. It is too late in the year to look for any increased business, unless caused by an advance in prices, which is not probable in general Hardware before January next. The country merchants generally are only buying to supply present demand, and are clearing the decks in anticipation of a heavy business next spring. Business in Heavy Hardware is decidedly more active than in Shelf Hardware.

Advices from St. Louis.—The Hardware jobbing trade continues to feel the effect of the late summer. Cold weather goods are extremely slow to move, and the manner in which retailers are holding off would lead one to the belief that there is to be no cold weather at all during the coming winter months. The result will be that with the first cold snap a rush of orders will be received and dealers will be greatly surprised because they do not get immediate shipment. The general tone of the market is excellent. More or less complaint is heard because manufactured goods have not advanced in proportion to the advance in raw material. The advances already made have been only moderate, and the market is all the better for it. Any radical advance in prices would check the demand very materially. Collections are quite satisfactory.

NOTES ON PRICES.

Wire Nails.—There continues to be a good demand for Nails and the market on the whole is in excellent condition. The demand, however, is a little spasmodic, and the market is not quite so active as some time ago. Prices remain as before. New York quotations are about $1.70 for small lots from store.

Advices from Chicago.—Orders for the past week have not been so many or as large in tonnage as previous to that date, which is a relief to manufacturers, who are buried under a lot of previous orders that will take the balance of this month to fill. All warehouses in the West are bare of stock. Very few orders are received from the South and Southwest on account of the yellow fever reports, business being practically at a standstill in that territory. There are current some reports of cut prices by jobbers on carloads, but manufacturers are adhering firmly to $1.60 to $1.65 for small lots from stock.

Advices from St. Louis.—The movement in Wire Nails is of moderate proportions. Jobbers and large retailers are carrying fairly large stocks, and while the demand is not particularly heavy there is no cutting in prices reported. Jobbers quote $1.65 to $1.70 base for small lots from store.

Cut Nails.—The arrangement between the manufacturers seems to be working smoothly. The demand, while not heavy, is at least fair and prices are well maintained. The New York price is $1.53 for less than carload lots.

Advices from Chicago.—There has been no change in the Cut Nail situation for some time and stocks in jobbers' hands are still small. Quotations are continued at $1.55 to $1.60 for small lots from stock.

Advices from St. Louis.—The movement in Cut Nails is not heavy and prices remain unchanged. Jobbers ask $1.45 base for small lots from store.

Barb Wire.—There is little change in the Barb Wire market, which is steady in the matter of prices, with a good but not especially heavy demand. Quotations continue unchanged.

Advices from Chicago.—Orders for the past week have fallen off in comparison with the last few weeks. Manufacturers are not finding any serious fault with this condition of affairs, as they are still crowded with work and have no surplus stock in hand. Presuming that the spring demand will be of great volume, they would welcome an opportunity to accumulate a stock for future delivery. Quotations are maintained at $1.60 to $1.65 for Painted and $1.90 to $1.95 for Galvanized, in small lots from stock.

Advices from St. Louis.—The demand for Barb Wire is not particularly heavy. The Texas trade, which is usually heavy during October, has been more or less disappointing. Jobbers report a fair trade at $1.65 for Painted and $1.95 for Galvanized.

Smooth Wire.—The market for Smooth Wire is in substantially the same condition as for the past week or two, and prices are well maintained.

Shot.—Under date October 18 the Eastern manufacturers announce reduced prices in Shot, as follows, there being the usual abatements for ton lots; terms, net cash 30 days, or 2 per cent. discount for cash in ten days:

Drop Shot, sizes smaller than B, per 25-pound bag	$1.30
" " " " " " " 5 " "	.30
" " B and larger sizes, per 25-pound bag	1.55
" " " " " " " 5 " "	.35
Buck and Chilled Shot, per 25-pound bag	1.55
" " " " " 5 " "	.35
Dust Shot, per 25-pound bag	2.00
" " " 5 " "	.50

The following prices are announced by Western manufacturers under the same date, terms as above:

Drop Shot, sizes smaller than B, per 25-pound bag	$1.20
" " " " " " " 5 " "	.30
" " B and larger sizes, per 25-pound bag	1.45
" " " " " " " 5 " "	.35
Buck and Chilled Shot, per 25-pound bag	1.45
" " " " " 5 " "	.35
Dust Shot, 25-pound Bag	2.00
" " " 5 " "	.50

Lalance & Grosjean Mfg. Company.—Under date October, 1897, Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, have issued a price-list of their Agate Nickel Steel and other Enameled Wares which they are manufacturing. Several new articles are represented in it. They call special attention in an introductory note to their Agate Nickel Steel Ware, alluding to its quality and the advantages it possesses from the way in which it is made. The following discounts are announced as applying to the various kinds of Enameled Ware which the company are putting on the market:

	Per cent.
Agate Nickel Steel Ware	40 and 10
Peerless Ware	70 and 10
Crystal Steel Ware	50 and 10
Blue and White Ware	50 and 10
White Ware	25 and 10

It will be observed that while the price of the Agate Nickel Steel Ware is maintained as before, a reduction in price is announced in the other wares.

Glass.—The American Glass Company have been perfected, according to reports, and only need a few finishing touches to arrange details and put in operation. The central idea of the new association is to have one agency to handle the output. All Glass is to be billed to the agency, and in this way it becomes the purchaser of all the output of the members of the association. Thus competition in selling is virtually done away with. It is probable that the association will control the sale of 95 per cent. of the Window Glass produced in this country. Little business is being done by New York jobbers, and prices range from 60 and 10 and 5 to 60 and 20 per cent. discount. Desirable orders accompanied by cash are reported as having been accepted as low as 70 per cent. discount.

Western jobbers of Window Glass at a meeting held at Chicago on Wednesday ordered an advance in prices of 5 per cent., to take effect at once, and notified the trade of another advance of not less than 5 per cent., to take effect November 1. Stocks of all the popular sizes of Window Glass in the West are said to be practically exhausted.

White Lead.—Orders for Dry White Lead have been fairly numerous, but not above the late autumn season average. Practically, the same remarks will fittingly apply to the movement of Lead in Oil. The price of base material has fallen considerably, or to the extent of about ¼c. per pound, but that corroders are influenced thereby is very doubtful. In any event list prices and terms remain unchanged, and indications are wanting of anything more than ordinary selling competition in this locality.

Red Lead.—A very fair business has been effected in both domestic and foreign makes, chiefly for future deliv-

eries, and about the usual movement in spot stock has taken place. Prices, however, have undergone very slight changes.

Linseed Oil.—Owing to the condition of the market for raw material and more temperate competition among crushers, wholesale prices of Oil made from American seed have been advanced 2c. The city brands are now quoted in small lots at 38c. for Raw and 40c. for Boiled.

Spirits Turpentine.—A sharp reaction in wholesale prices has taken place, owing to disarrangement of speculative deals, and retail prices have been marked down to 34c. to 34½c.

Old Rags, Paper, &c.—The market is fairly active for almost all lines of Paper Stock. Prices are still low, though with a stiffening tendency. Dealers' purchasing rates, New York City delivery, are about as follows:

No. 1 White Rags	per lb.	2⅝ to 2¾c.
No. 2 White Rags	per lb.	1¾ to 1⅞c.
Mixed Rags	per lb.	1 c.
Blues and 3ds	per lb.	1 c.
Hard Sized White Shaving	per lb.	1¾ to 2 c.
No. 1 White Book Shavings	per lb.	1½c.
No. 2 White Book Shavings	per lb.	¾ to 1 c.
Light Book Shavings	per lb.	½ to ¾c.
No. 1 Mixed Shavings	per lb.	¾ to ⅞c.
No. 2 Mixed Shavings	per lb.	½ to ⅝c.
No. 1 Printed Books	per lb.	⅞ to 1 c.
Ordinary Mixed Books	per lb.	½c.
Newspapers	per lb.	½ to 3/5c.
No. 1 Manila Paper	per lb.	⅝ to ¾c.
No. 2 Manila Paper	per lb.	⅜ to ½c.
Bogus Paper	per lb.	⅜c.
Common Paper	per lb.	¼ to 3/10c.
Straw Chips	per lb.	⅜c.
Binders' Clippings	per lb.	½c.
Jute Butts	per lb.	1⅛ to 1¼c.
No. 1 Jute Bagging	per lb.	¾ to 1 c.
Mixed Bagging	per lb.	½ to ¾c.
No. 2 Bagging	per lb.	½ to ¾c.
Hemp Twine	per lb.	1⅜ to 1¾c.
Manila Rope	per lb.	1¾ to 2 c.
Jute Rope	per lb.	1½ to 1¾c.
Mixed Rope	per lb.	¾ to ⅞c.

Old Rubber.—The demand is quite good, especially for Rubber Shoes, and prices are decidedly firm. Local dealers are paying about the following figures:

Car Springs, ton lots, per lb	3½ c.
Rubber Shoes, carloads, delivered at factory, per lb	4¾ to 5 c.
Rubber Shoes, less than carloads, per lb.	4.70c.
White Wringer Rolls, per lb	4 c.
White Syringes, per lb	4 c.

TRADE NOTES.

The Lynchburg Brass Mfg. Company is the title of a new concern who have been organized, with a capital of $20,000, to operate the plant formerly owned by the Maryland Brass Manufacturing Company of Aberdeen, Md. The entire plant will be moved to Lynchburg, Va., and is expected to be in operation in its new location before the end of the year. The new company will manufacture all kinds of Brass Goods The officers are John S. Slaughter, president ; William Hurt, vice-president ; E. O. Bayles, secretary and treasurer, and E. S. Whiting, general manager.

The Abendroth & Root Mfg. Company, New York, have booked a contract for the water works system at Siloam Springs, Ark., involving some 30,000 feet of 4, 6, 8 and 10 inch Abendroth & Root spiral riveted pipe. The value of the contract is nearly $10,000.

The National Tube Works Company have placed in front of their warehouse at the corner of Fulton and Clinton streets, Chicago, a typical industrial column which will attract as much attention as a monument. It consists of a full length of 30-inch wrought pipe, standing on end on a massive concrete base. It bears the following inscription in large gilt letters : "30-inch lap weld wrought pipe, with Converse patent lock joint, flanged, tested 800 pounds square inch, and the largest lap weld ever made in the world."

The Stirling Metal Company, Stirling, N. J., announce that they have secured the services of Dr. Herbert G. Torrey as consulting expert. Accompanying the announcement is a cricular calling attention to the Stirling Anti-Friction Metal, also the various grades of Babbitt metal, white brass, and car and journal boxes which they make.

An East Indian journal suggests that it would pay good American japanners to open a business in the large cities of India. To begin with, the bicycles that have to be repaired are villainously enameled by the native workmen. An enormous number of boxes of various sorts are already made in the country, including cash, dispatch, uniform and other boxes, and in every case they have an inferior coating. Japan coatings are of especial value in a moist climate like that of Bombay, which is so severe on iron and steel. These metals are being more used every day in the making of carriage wheels, and for these japan is the most suitable coating, being adhesive and easy to clean.

Marks Lissberger & Co. issue a notice to the trade stating that when they moved their office and works, formerly the New York Smelting & Refining Company, to their new building, 393-397 West Twelfth street, New York City, they thought their facilities would be more than ample. They found, however, that their business has grown so rapidly that they are already pressed for room, and have therefore leased for a number of years the Brooklyn Smelting & Refining Works, 375-383 Driggs avenue, Brooklyn, the former proprietor of which, Daniel Culbaine, will continue in charge.

TAUGHT BY MAIL

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

SENT, POSTPAID, ON RECEIPT OF PRICE, BY

—Not His Kind of a Job.—There was once an Irishman who sought employment as a diver, although he had never been beneath the water. The firm chanced to need a new man, and so on the following Monday morning Pat hid his smile for the first time in a diving helmet. The crew to which Pat had attached himself was working in comparatively shallow water, and Pat was provided with a pick and told to use it on a ledge below. Down he went with his pick, and for about fifteen minutes nothing was heard from him. Then came a strong pull on the signal rope, indicating that Pat had a very decided wish to come to the top. The assistants pulled him hastily to the raft and removed his helmet. "Take aff the rist av it," said Pat. "Take off the rest of it?" "Yis," said Pat. "Oi'll worrik no longer on a job where Oi can't spit on me hands."—*Boston Budget.*

—His Awful "Break."—"My dear, I am surprised that you should accuse me of being intoxicated last night. Did I not sit up an hour after I got home, smoking and reading?" asked he.

"Yes, and do you know what you were smoking? It was one of my hair-curling kids."—*Cincinnati Commercial-Tribune.*

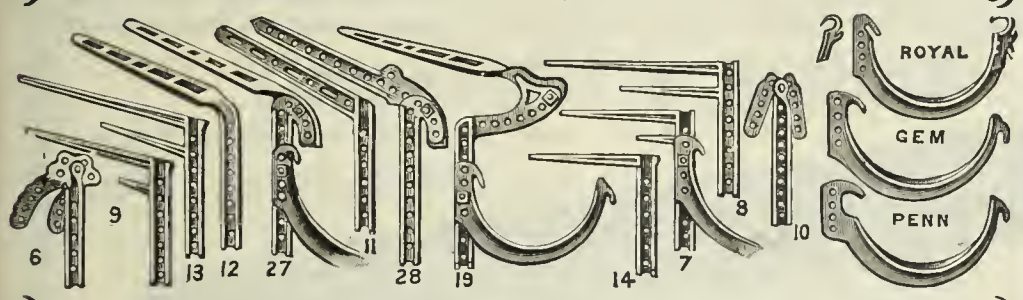
MANUFACTURERS
Binghamton, N.Y. U.S.A.

Berger's Gutter Hangers.

Tinners can find among our complete line a style of hanger to suit any kind of roof; it only requires the proper selection. Attention is called to the **Hinged Shanks**, made for any pitch roof. All are strong and easy to put up, leave a free open gutter, and are neat in appearance. No. 34 is specially made to hang gutter to corrugated iron roofs and awnings. Send for our **HANGER CIRCULAR**, which clearly illustrates them all.



Every customer who uses the Gem Circle should ask for a free sample of the new Royal Circle with next shipment.

B. B. Pipe Fasteners

are so simple, so good and so cheap that there is no excuse for using a poor one. We will convince you if you will write for a free sample.

Length of drive and whether for wood or brick should be stated.

Berger's Pat. Standing Seam and Slate Roof Snow Shoe Irons

are a great success, and you should not buy any other before examining them. A good article at reasonable price.

—AN ANECDOTE OF JEREMIAH MASON.—Mr. Mason was himself once subjected to a species of cross-examination. Being in Newport, a distinguished member of the Rhode Island bar, who had never before met him, had heard of his habit of asking questions, especially of new acquaintances, and, when presented to him, he determined to be first in the field with regard to this particular qualification, and accordingly began the conversation with a series of questions. He asked Mr. Mason whether he liked this, or whether he affected that, and some of the questions were answered, while others were parried. Finally the interrogator said:

"Well, Mr. Mason, tell me what you do like."

Quick as a flash came the reply from the great New Hampshire lawyer:

"Why, I like to sit in this chair and have a Rhode Island lawyer ask me questions."

There were no more questions asked.—*Boston Herald.*

TINNERS' SUPPLIES

—IT LOOKED THAT WAY.—"Your father has an idea that you are going to marry a worthless, good-for-nothing fellow, but aha! I will fool him!" "Gracious; you are not going to break off the engagement, are you?"—*Life.*

—A MAN went to a local boxing instructor the other day and asked him how much he would charge him for twenty-five lessons. The instructor told him his terms, and the lessons commenced. After two lessons the pupil, who was somewhat the worse for wear, remarked to the professor: "You see, I wanted to take enough lessons so that I could learn enough about the manly art to lick a man. I've changed my mind now. I guess I will send the fellow down to take the rest of the lessons."—*Rochester Democrat and Chronicle.*

ELBOW CHART

—FOR—

TIN and SHEET IRON WORKERS,

Giving the Rise of the Miter Line of Elbows of any Diameter and Number of Pieces and for any Angle.

This is an easy and practical system of producing elbow patterns for the use of all light or heavy sheet metal workers. It is simple, accurate and most valuable, being the only *thumb* rule ever produced from which accurate results may be expected. Every good workman has some rule by which he may develop a satisfactory pattern for Elbows at right angles, but when something different is wanted, it is a little trouble. By the use of this chart he can safely depend on getting a correct pattern for any elbow, no matter of what diameter, number of pieces or angle, and mark it out direct on his strip of iron or tin, almost as quick as if he had a pattern. This chart has more combinations and measurements than may be counted, and will be a great help to young or old at the business.

Domestic Electrical Work.

Concise and Practical Explanations for Plumbers, Tinners and Hardware Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

By WILLIAM A. WITTBECKER.

Price in Paper, 25 Cents.
Price in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructious whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed. The information given is above all else practical, and with a close observance of the directions laid down any one without the slightest knowledge of electricity should be able to do the work described.

CONTENTS.

Chapter I.—Simple Bell Circuit.
Chapter II.—Multiple Bell Circuit.
Chapter III.—Various Circuits.
Chapter IV.—Fire Alarms.
Chapter V.—Anuunciators and Alarms.
Chapter VI.—Burglar Alarms.
Chapter VII.—Automatic Fire Alarms.
Chapter VIII.—Electric Gas Lighting.
Chapter IX.—Running Wires in Finished Buildings.

Instructions on Joint Wiping

FOR BEGINNERS IN PLUMBING.

With thirty-five illustrations; 43 pages.

Paper, 25 Cents.

This book contains a reprint from *The Metal Worker* of two articles on the method of joint wiping, an operation calling for a very large degree of manual skill. The first account is written by a practical plumber, and is illustrated from photographs faithfully representing the hands and tools when wiping joints in various positions. The second account, by an expert joint wiper, is also illustrated from photographs and will prove of great assistance to learners. Ample instructions are given on preparing the pipes previous to wiping the joints, with full descriptions of all tools and appliances used. The pamphlet, in short, gives all the assistance that description of the work can furnish and is the most practical and complete account of joint wiping that has been published.

Sent, post-paid, on receipt of price, **25c.**

BICYCLE REPAIRING

A MANUAL COMPILED FROM ARTICLES IN "THE IRON AGE."

By S. D. V BURR.

166 pages, illustrated throughout, cloth, price, **$1.00.**

This book presents in rearranged and handy reference form a series of articles on the repairing of bicycles which has been recently published in *The Iron Age.*

Various operations and effective methods of repairing are carefully described, and over one hundred and fifty illustrations are included, which add to the simplicity and interest of the text by showing the work in course of progress.

The book is entirely practical, describing only methods which have been tested and found reliable. It is recommended not only to manufacturers and dealers in bicycles, but to hardware dealers handling wheels, bicycle repairers, and to all those having shops who are called upon to repair machines.

TABLE OF CONTENTS:

Chapter I.—Equipment of the Shop—Tools and Arrangement.
Chapter II.—Stands for Holding the Bicycle.
Chapter III.—Brazing—Furnaces, Flux, Spelter.
Chapter IV.—Tempering and Case Hardening.
Chapter V.—The Frame—Fitting, Brazing, Truing, Testing.
Chapter VI.—The Fork—Restoring, Truing, Testing.
Chapter VII.—The Wheel—Stringing Up, Truing. Drilling Rims.
Chapter VIII,—The Tire—Single Tube, Inner Tube Repairing.
Chapter IX.—The Valve—Replacing, Repairing.
Chapter X.—The Handle Bar—Bending.
Chapter XI.—Miscellaneous Hints.
Chapter XII. — Enameling — Liquid, Ovens, Directions.
Chapter XIII.—Nickel Plating—Equipment, Directions.
Chapter XIV.—Keeping Track of Work—Shop Accounts, Charging.

PRICE, POSTPAID, $1.00.

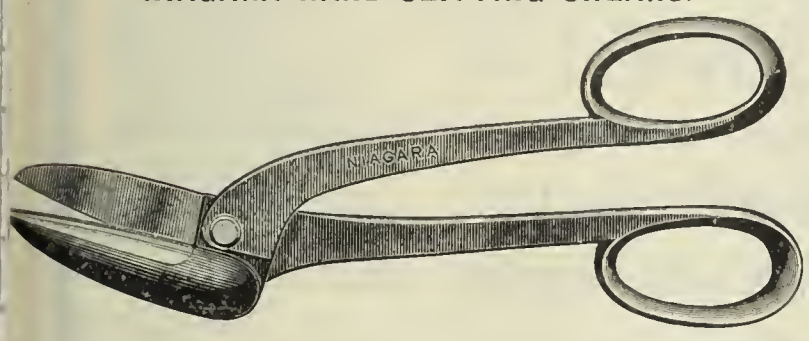
THORN SHINGLE & ORNAMENT CO.,
1221 Callowhill St., Philadelphia, Pa.

Niagara Stamping and Tool Co., Buffalo, N.Y.,

MANUFACTURERS OF

Tinsmiths' and Roofers' Tools, Shears, Presses, Dies, and Special Machinery for Sheet Metal Work.

NIAGARA HAND SLITTING SHEARS.

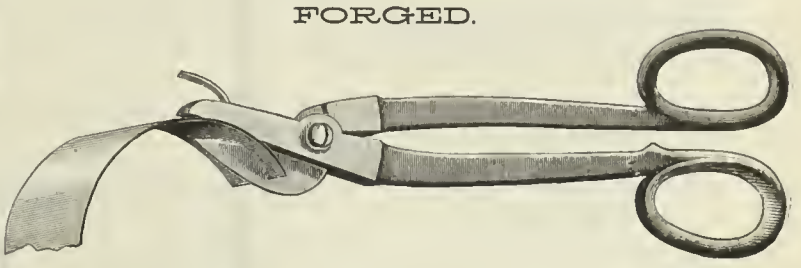


These Shears are distinguished from ordinary Tinners' Shears through the peculiar shape and arrangement of the jaws and handles. The lower jaw is relieved to allow the material to slide backwards freely. Both of the handles remain above the work while cutting. A sheet of any length can be cut apart without trouble and injury to the hands of the operator.

They are especially adapted to cutting apart long sheets, cutting corrugated sheets lengthwise, which cannot be done with ordinary snips, and they are very handy in taking up and repairing metal roofing. Drop forged of best wrought iron and with steel-laid jaws, carefully tempered.

NIAGARA DOUBLE CUTTING SHEARS.

FORGED.

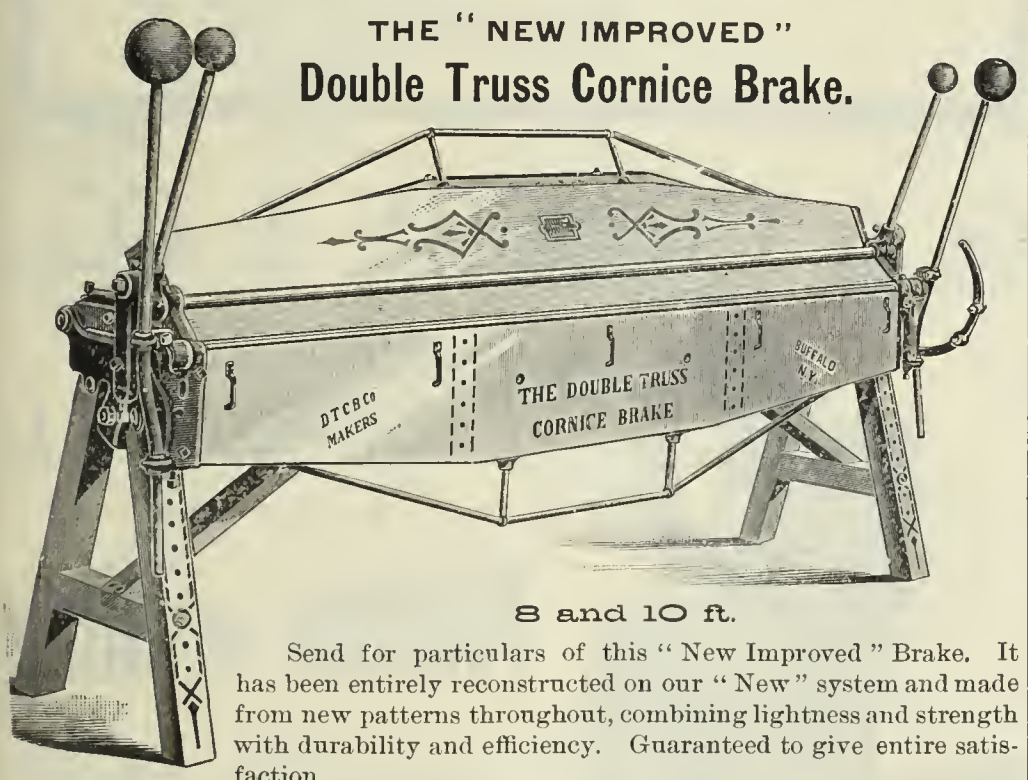


Niagara Double Cutting Shears are made in the most durable manner. The center blade is of solid tool steel, and the outer jaw is laid with tool steel. Both handles are drop-forged of wrought iron.

The Double Cutting Shears were designed especially for cutting apart cylinders of sheet metal. They are also very useful for cutting holes in sheets, cutting off the bottoms of cans, pails, etc., and a variety of other work. The center blade is pointed so as to be readily inserted in the sheet at any point, to start the cut. A narrow strip of metal is cut out, and both edges are perfectly smooth.

THE "NEW IMPROVED"

Double Truss Cornice Brake.



8 and 10 ft.

Send for particulars of this "New Improved" Brake. It has been entirely reconstructed on our "New" system and made from new patterns throughout, combining lightness and strength with durability and efficiency. Guaranteed to give entire satisfaction.

SENT ON TRIAL.

The New

Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. **Terms and Definitions—15 pages.**
II. **Drawing Instruments and Materials —13 pages.**
III. **Linear Drawing—6 pages.**
IV. **Geometrical Problems—35 pages.**
V. **PRINCIPLES OF PATTERN CUTTING—25 pages.**
VI. **PATTERN PROBLEMS (3 Sections) —325 pages.**
1. MITER CUTTING,
2. FLARING WORK,
3. TRIANGULATION.

E. W. BLISS CO.,

16 Adams St.,
Brooklyn, N. Y.

OWNERS OF THE STILES AND PARKER PRESS CO.

NO. 153B "BLISS" PARALLEL SHAFT BEADING AND FLANGING MACHINE.

In the ordinary type of Beading and Flanging Machine, the shafts open apart by a hinge at the end. Unless the shafts and rolls are adjusted with the greatest nicety, satisfactory work cannot be secured. This is due to the fact that, when the shafts are thrown apart to put on or remove the work, they are farther apart at the outer point of contact than at the inner. This also makes it impracticable to shift the position of the rolls to suit cans of various lengths, unless they are of the exact diameter required to bring the shafts parallel. If not so made, when the rolls are brought closer together or moved farther apart, the parallelism of the shafts is destroyed and the rolls do not fit.

To overcome this difficulty, we have designed the machine shown in the accompanying illustration. In it the upper shaft bearings have a hinge parallel to the shafts. When the two shafts are separated their parallelism is not disturbed. Thus the outer rolls may be placed at any point on the lower shaft, making the machine available for a wide range of work. The shafts are brought into working position by the hand wheel shown instead of by the usual foot treadle.

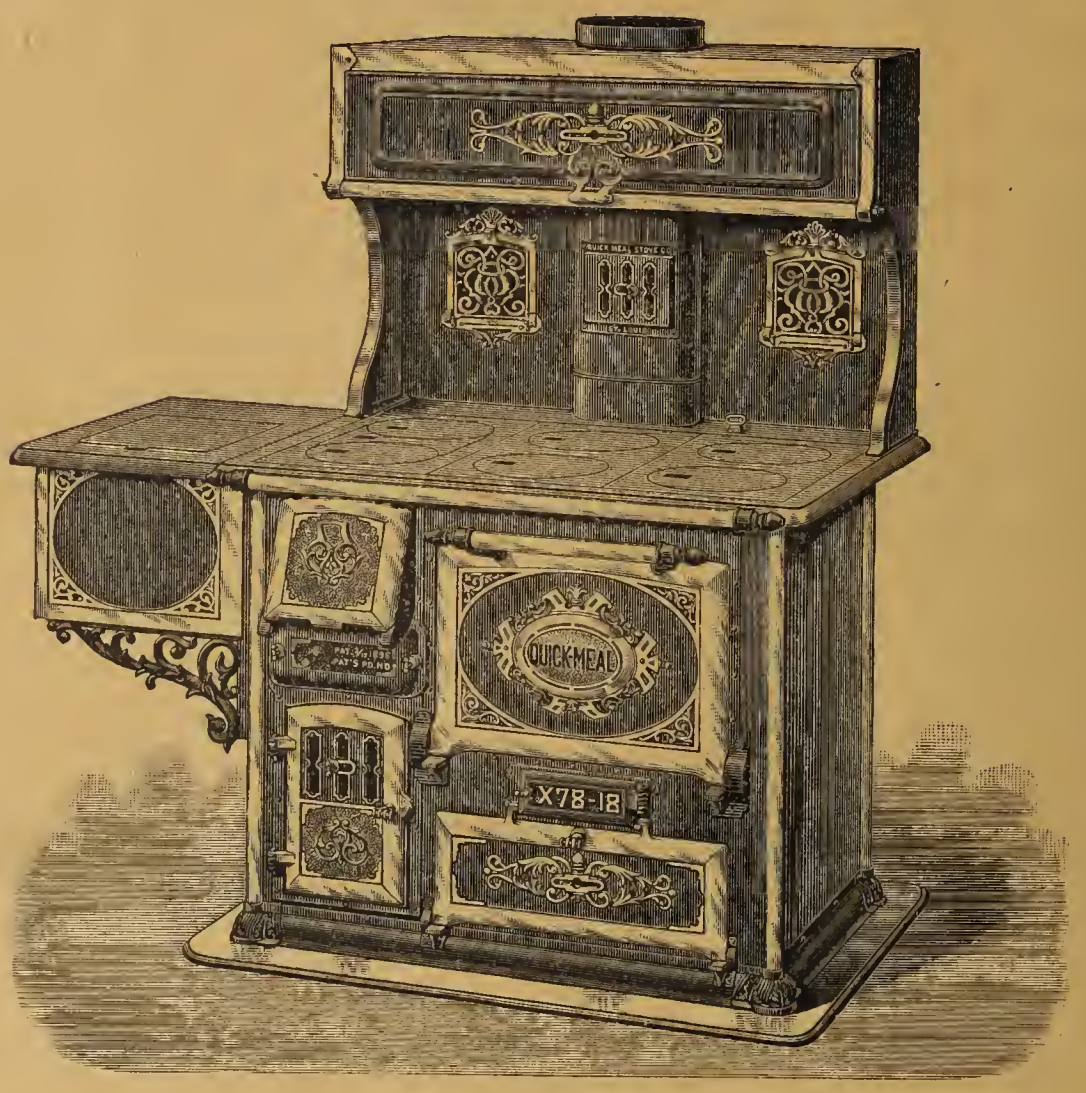
SEE THE MAGEE Advertisement PAGE 24.

"Quick Meal"

STEEL RANGE.



It is of the utmost importance that a Steel Range should have a perfect Reservoir, one that will give plenty hot water and yet will not keep boiling and filling the kitchen with steam when not wanted. The "Quick Meal" Reservoir is made in two ways—enclosed, flush (as shown above), or exposed. The Enclosed is the neatest and most convenient—the other is the cheaper. Either is perfect in its way.

Either can be removed from the Range for cleaning by simply lifting it off. The heat imparted to the water can be nicely regulated. If too hot—slide the Reservoir away one inch from the Range. There is no damper connected to the Reservoir to mix people up. It is entirely independent, will heat at all times and will never interfere with the baking. There is no water connection to be made and liable to leak. There is no pipe to clog up with lime, mud or alkali or to burn out, or to freeze up and burst. It does not frighten the user by noisy boiling or knocking, nor condense the steam and drip it on the floor. The Reservoir is made of heavy copper, tinned inside; the cover is neatly japanned. It is neat, handy and does its work to perfection.

THE FORBES WARM AIR FURNACE.

PHILADELPHIA, April 10, 1897.

Messrs. TUBULAR HEATING AND VENTILATING CO., 228 Quarry Street, Philadelphia.

GENTLEMEN:—The Forbes Warm-air Furnace placed in my house last fall has given me entire satisfaction.

During the greater part of the winter the house had to be kept at a very high temperature, owing to illness in the family. Your furnace did all it was called upon to do, and on a remarkably small amount of coal.

Last winter a furnace of a popular make failed to even warm the house comfortably, and burned fully 50% more coal.

I think your furnace is all you claim for it, and do not hesitate to recommend it to any one desiring comfort and economy. Very truly,

Peerless Andes.

Entirely New. *Finest Range Ever Made.*

WE present the latest addition to the ANDES line of Stoves and Ranges. As will be noticed from the above cut, the design is bold, up to date, and strictly correct, artistically considered. This range is unusually large in every way. It has every improvement which is at all desirable. The oven is very large and well ventilated; heated on five sides The ash pan is unusually large. The fire box is a new and improved form, perfect in its fittings. The grate is of our own improved style of draw out form, together with our own patent arrangement for taking out the single bars without removing the fire box. The entire grate can be drawn out without removing the fire box. The wood fixtures for this range we claim to be better than any heretofore made. The reservoir is unusually large. The oven door, as is shown in the above cut, has the best form of oven thermometer made. The top oven plate is cemented. The bottom of the stove is double. The back of the oven is double. An elegant nickel band on the edge of main top, and also on the edge of high shelf. Reed's patent check damper. Towel rod. Elegant plate panels. In every respect this range is as good in design, form, weight, quality of castings and mounting as can possibly be made. The prices will be right.

The Radiant Andes.

Entirely New. Medium Price.

ELEGANT Plated Trimmings, Handsome, Attractive, Large Sizes, Large Pan, Heavy Pots, Heavy Stoves, Well Made, Durable Stove, Good Hot Air Flue. Every Stove a Double Heater, Duplex or Draw Centre Grate.

Two sizes, No. 13, 13-inch Fire Pot.
" 15, 15 " " "

An important addition to the Andes Line, a handsome, attractive. well made stove, very heavy pots, durable in all parts; it is made to suit the times. Prices are right and will interest the buyer.

Oak Andes.

EVERY manufacturer claims he has the *BEST OAK STOVE.* Every buyer wants the *BEST OAK STOVE,* and without the least fear of contradiction we offer to the trade the

OAK ANDES as the best BEST OAK STOVE.

It has the *BEST AIR TIGHT JOINTLESS BOTTOM,* the *BEST AIR TIGHT REGISTER DAMPER,* the *HEAVIEST FIRE POT,* the *HANDSOMEST DESIGN* and the *BEST WORKMANSHIP* of any stove on the market.

It is beyond question an *AIR TIGHT STOVE.*

The sales for 1896 were four times as large as the manufacturers expected and the indications are now that the capacity of the works will be severely taxed to meet the demand for the present year. Buyers who wish the best should secure agency at once.

SPECIAL RETORT OAK,

Entirely New in Principle and Construction.

AT LAST SOMETHING NEW IS OFFERED THE STOVE TRADE.

HANDSOME, DURABLE and LOW PRICED.

We guarantee *THE SPECIAL* to be the best Stove for Hard Coal ever built.

We KNOW it is the best SOFT COAL STOVE in the world.

As a COKE BURNER it is PERFECTION ITSELF.

This CONSTRUCTION has been recently patented, and will be controlled by us for the next 17 years.

We know the trade is supplied with stoves for this year, but it will be wise to investigate the merits of *THE SPECIAL RETORT OAK* by ordering samples and testing the stove before making arrangements for next season's business.

Please write us for booklet containing record of tests of various Coals and Coke to determine their relative values as fuels, and also description of *THE SPECIAL RETORT OAK*, the Stove in which these tests were made.

4 SIZES, Nos. 14, 16, 18 and 22.

ADDRESS

MARION STOVE CO., - - Marion, Indiana.

Say what paper you saw this in.

Why

Are the *ACORN STOVES AND RANGES* sold more generally than any others ?

Why is it that our enormous foundries are being pushed to the utmost capacity to supply *ACORNS* ?

This question practically answers itself. Stove Merchants realize that in the ACORN Line they can get the specialties they need *to suit their peculiar wants,* and a variety large enough to suit the whims of their customers. Then, too, these specialties cost from $2.00 to $4 00 less than other stove concerns ask for some=thing not so good as *ACORNS.*

You see in other so=called "lines" some particular stove or range that the makers claim great things for, but you can match *any* of them with an *ACORN,* and beat them, both in selling features and price

If you have not tried it, we can prove it to you.

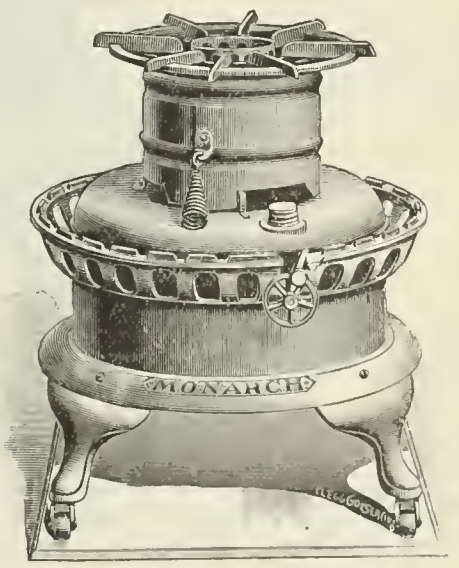
Monarch Blue Gas Flame Oil Heating Stove.



The phenomenal success of the "Blue Flame" oil burner of the past two years has created a "Macedonian Call" for a heater made on the same lines, and the "Monarch" steps foward to supply the demand. It has been on the market one year, and for the season of 1897-8 is presented with several important improvements which a year's experience has suggested and we offer it with all confidence in its efficiency, cleanliness, intense power and great comfort.

HERNDON, IA., Oct. 6th, 1897.

The Monarch Stove Co., Mansfield, Ohio.

Gentlemen:—Last year I bought an Oil Stove from you, and now want a new wick.

The Stove has given the best of satisfaction, is perfectly safe, and the best of it is, it furnishes lots of heat and no smoke or odor whatever. It is a gem and a success. We used it all last winter.

Yours respectfully,

F. C. JONES, M. D.

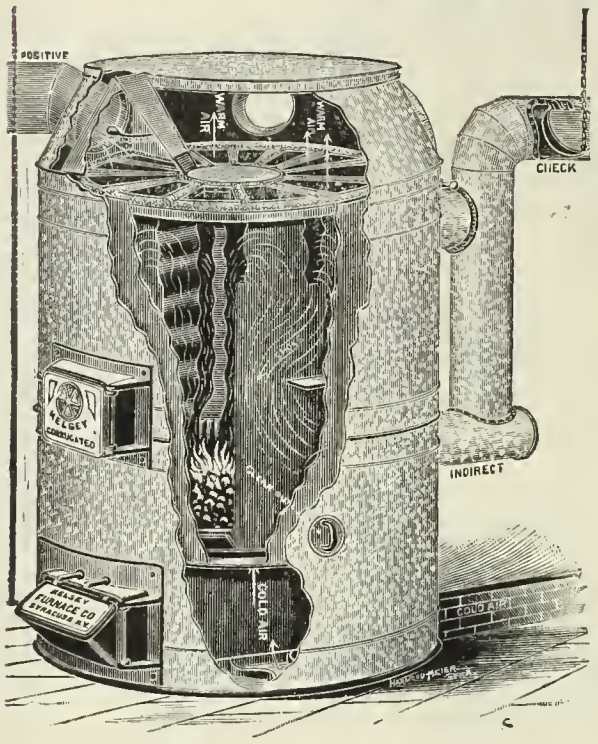
WARM AIR GENERATORS

BURN

WOOD, COAL OR COBS.



NELSON, ILL., June 8, 1897.

MESSRS. F. R. TAYLOR & CO., STERLING, ILL.:

Gentlemen:—After the completion of my new residence, four years ago, I investigated the various methods of heating the same, and finally decided upon the Kelsey, and am happy to say, have never had cause to regret my choice; it has given perfect satisfaction, and we have enjoyed an atmosphere, even in the coldest weather, that seemed like a June day.

The air from the Kelsey has none of the hot, stifling, drying properties, but seems pure and fresh as summer.

Our house is very large, but we find no difficulty in heating the whole of the same, and potted plants here thrive as though in the Tropics. We have burned hard coal, wood and cobs, all with equal satisfaction. In fact, it is difficult to express in a few lines the comfort and satisfaction derived from the use of the Kelsey.

Yours very truly,
GEORGE S. RANSOM.

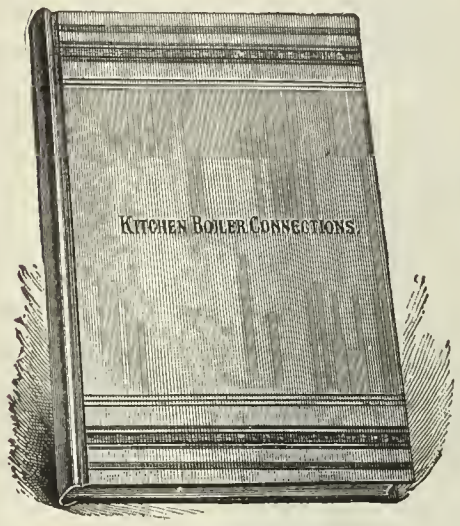
KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

Compiled from THE METAL WORKER.

71 Illustrations, 8vo, 140 Pages, Cloth.

Price, $1.00.

The pnblisher of this work is well known for his former successful efforts in the pnblication of useful and thoronghly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The book is well got up and the information well given. Those interested in works of this character will do well in bnying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Both interesting and instructive to onr trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It con tains a table of contents and an index.—*Scientific American.*

A well bound, well printed, well illustrated and well edited book. . . The special field of this work is very thoroughly covered. . . Abounding in rare technical information of a practical character.—*American Artisan.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

THE METAL WORKER ESSAYS

—ON—

HOUSE HEATING

—BY—

Steam, Hot Water and Hot Air.

With Introduction and Tabular Comparisons.

Second edition, revised. To which has been added a selection from the Letters of Criticism on the Essays as originally published in *The Metal Worker* and a chapter on Proportioning Radiating Surfaces.

"The various subjects treated on are indicated by marginal sub-headings for reference purposes, and the illustrations, computations, &c., are plain and easy of understanding. The book may truthfully be said to be a careful compilation of the best ideas of those best qualified to speak on the subjects treated of, and to form as a whole the very latest and most valuable literature on a topic which is becoming more and more recognized as being of the first importance in the building and furnishing of healthful homes."—*The Building Trades Journal.*

"It constitutes one of the most valuable works on the subject of house heating hitherto published. It is a terse compendium of practical knowledge of all that is most useful on the subject, wholly ignoring an enormous amount of useless speculation upon the subject comprised in numerous volumes and the current literature of the day—written by persons who adopt theories and vainly search for facts to sustain them—not worth the reading. Per contra, the work before us is alike commendable to major-domos who would be well informed on the subject, and to engineers of heating and ventilation, who cannot afford to do without it."—*The Sanitarian.*

"Practical men have contributed of their knowledge in such a way and in such a form as to make the subject interesting as well as highly instructive, and with copious tables and diagrams showing the various methods of piping, &c., the work is unlike any book published. The book treats the subject in a common-sense method and goes directly to the point without any theorizing. It is a valued work and worth the money it costs many times over. It should be read by all devotees of the systems advocated in its pages, as it deals with a subject that is becoming more and more important every year, and one that demands the best thought and the highest skill of every workmau."—*Register and Bulletin.*

"It is a practical book. It does not contain rules that depeud for their integrity upon one set of conditions, and which may not suit any other condition. The book is for the student, and when studied it will be found surprising how much information it contains that may not appear by a superficial glance or hasty examination."—*Boston Journal of Commerce.*

The work is handsomely presented in a volume of 288 pages in the form of a hand reference book, with mauy illustrations, showing the several ideas and methods of heating, ventilation and economical arrangement of pipes and radiators, &c. The very complete specifications of materials which accompany several of the essays give a value to the work that will be understood and appreciated by the architect and builder who aim for excellence in this branch of house building."—*The National Builder.*

James Squire, Youngstown, Ohio.—"If we had only had the information contained in this volume in earlier life, we could now have dollars where we only have buttons."

WOOD FURNACES

OUR IMPROVED MONITOR.

With DIRECT and INDIRECT DRAFT, is made in two sizes for Brick or Galvanized Cases.

No. 38 burns 3 ft. wood, No. 50 burns 4 ft. wood.

THE MONITOR.
ESTABLISHED 1839.
INCORPORATED 1894.

The fire-box is made of cast iron, **corrugated very heavy** and **substantial.** The dome and radiator are made of **heavy plate** iron (gas tight).

This furnace can be set in low cellars and is easily put into old brick work. With smoke pipe removed, radiator can be cleaned thoroughly in five minutes, by means of clean-out door in front.

Simple to manage and most economical in fuel, with an immense heating power.

We also make the **CLIMAX and HOT BLAST WOOD FURNACES,** the best of their kinds at a lower price. Thousands in use in all sections of the country.

Testimonials and full particulars sent on application to the manufacturers.

WOOD & BISHOP CO., Bangor, Me.

HOWARD AUTOMATIC DRAFT REGULATOR

GOVERNS HOT AIR FURNACES, STEAM BOILERS and HOT WATER HEATERS.

It does not depend upon *Electricity, Vapor, Clock Work*, or *Compressed Air* for power, but simply the contraction and expansion of compact material which is *GUARANTEED* to last *A LIFETIME*. Also its simplicity enables it to *regulate itself* as well as the heater.

FRONT RANK STEEL FURNACE

SEND FOR CATALOGUE.

FRONT RANK STEEL FURNACE CO., ST. LOUIS.

—HERE is one of the last stories from Monte Carlo: While the solemn function of displaying, mixing and shuffling the cards which precedes the beginning of the play was being gone through, a gentleman walked up to the tables, deliberately counted out a lot of bank notes, in value $2,500, and placed them on the black. This somewhat unusual occurrence of staking a maximum before the play for the day had begun naturally attracted attention, and a bystander remarked:

"Rather bold play, sir."

"Well," said the player, "I dreamed last night that I saw the table exactly as it is now, and on the first coup black won."

The cards being duly cut, the tailleur proceeded, watched by the onlookers with unusual interest, to deal out the cards for the first coup, and black won. A suppressed "Oh!" from the bystanders greeted the announcement, and then from across the table came, in tones of agonized entreaty, a lady's voice:

"What did you have for supper last night? Do tell me!"—*New York Tribune.*

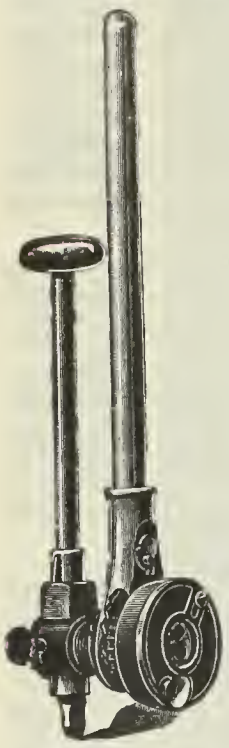
MANUFACTURED ONLY BY

Peck Brothers & Co.,

NEW HAVEN, CONN.,

NEW YORK. BOSTON.

The Climax Ratchet Stock.



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe, and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00

For sale by leading jobbers.

Manufactured Solely by

THE NEW
METAL WORKER
PATTERN BOOK.

A Treatise on Pattern Cutting as Applied to all Branches of Sheet Metal Work.

By GEORGE W. KITTREDGE.

430 Pages; 744 Illustrations; size, 10 x 13 inches, Cloth Bound, Price, . . $5.00.

The Most Elaborate and Complete Work that has ever been brought out for the use of Sheet Metal Pattern Cutters.

Printed from new type with a new and improved arrangement, especially convenient for reference and study.

Parts of the former treatise, entitled The Metal Worker Pattern Book, have been utilized in the preparation of this

GREATLY ENLARGED AND IMPROVED WORK,

but these have been REWRITTEN AND SIMPLIFIED, and later methods embodied which have come into use since the publication of the original work.

218 Problems are now given,
75 of which are entirely new

The greatest care has been taken with the explanatory portions of the work, enabling the student, without any previous training in mathematics and drawing, to become a FINISHED PATTERN CUTTER.

Apprentices and Students will find the entire subject presented in such a manner as will facilitate systematic study.

Tinners and Cornice Makers will here find elucidated every problem of ordinary occurrence, from the simplest to the most complex.

Triangulation is here for the first time treated systematically and in a way to meet the practical needs of the trade.

The opening chapters are devoted to the preliminary information necessary to give the student a thorough understanding of the subject, treating the topics fully and with appropriate illustrations. The work is comprised in the following chapters:

I. **Terms and Definitions—15 Pages,**
II. **Drawing Instruments and Materials—13 Pages,**
III. **Linear Drawing—6 Pages,**
IV. **Geometrical Problems—35 Pages,**
V. **PRINCIPLES OF PATTERN CUTTING—25 Pages,**
VI. **PATTERN PROBLEMS (3 Sections)—325 Pages.**
   1. MITER CUTTING,
   2. FLARING WORK,
   3. TRIANGULATION.

This work in its perfected form is a complete

Encyclopedia of Pattern Problems

for Tinners, Cornice Makers and Sheet Metal Workers, all of whom should be provided with a copy.

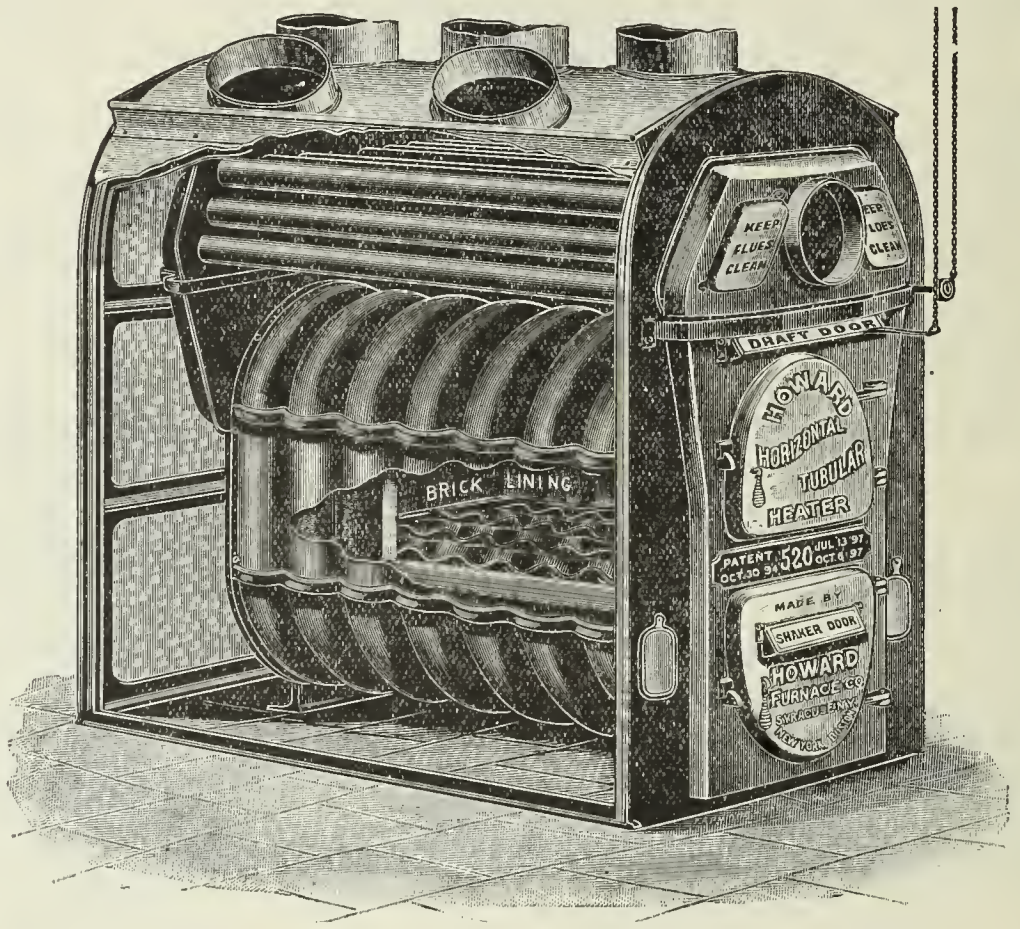
DAVID WILLIAMS COMPANY, Publishers, 232-238 William St., New York.

On the Right Track

With this Furnace the chemical change which takes place in the combustion of fuel is obtained in the most perfect way without waste of heat. It is built on the well-known air-tight principle. This means a radical difference in furnace construction. It means new ideas, advanced thought and progressiveness on our part. To every dealer in the land it means a new furnace. We are desirous to make it known. We solicit questions about it. Write us to-day.



Patented: Oct. 30, 1894. July 13, 1897. Oct. 5, 1897.

With a Hollow Front

It sets men thinking. The construction is not ordinary. The front assists in supplying to the fire a hot draft. Inspection shows a peculiar and distinctive arrangement of dampers. A fire in this furnace can be held under control to meet the most exacting requirements. The capacities are warranted to be as published.

The Business Situation.

No elements of extraordinary interest have been contributed to the business situation during the past week. Mercantile reports from various quarters and the statements of local business men indicate a somewhat slower movement of trade than was the case a few weeks ago, and the advancing tendency in prices seems to have suffered a check in some directions. The falling off is naturally most pronounced in the South, where the yellow fever quarantine hampers trade to a material extent. But it is also apparent in the East, where consumers of goods do not, at the moment, show much disposition to buy with a free hand or to anticipate their wants to any extent. In the West and Northwest, however, trade is quite brisk. The setting in of colder weather is stimulating the demand for winter goods, and the improved financial status of the farmers enables them to purchase more freely than they have been in a condition to do for years. Looking over the field at large, it is beyond question that the great majority of people throughout the country are suffering very much less from business depression than formerly, while the improvement in large sections is radical. Merchants and manufacturers, while expecting a fair average business, do not look for any material increase in its volume during the balance of this year. But all unite in the expectation of a steady increase in business activity from the opening of 1898. At the same time evidence of an unusually large amount of current business is seen in the heavy returns of bank clearings—an infallible barometer. Last week's aggregated clearings reached a total of $1,304,740,542, a decrease of a fraction of 1 per cent. from the previous week's total, but 30 per cent. over the corresponding week of last year, while the clearings for the past four weeks have been at the rate of more than $68,000,000,000 a year, the largest figures ever reached. Current railroad earnings are from 12 to 15 per cent. better than a year ago. Exports of agricultural and manufactured products continue extraordinarily large, while imports are relatively light, thus swelling the foreign trade balance in our favor. The gold reserve is well past $150,000,000, and is growing. Money is in abundance in the banks, and loaning rates are easy. In the iron trade mills are crowded with orders, and prices of pig iron and rolling mill products are strong. Little change is noted in metals. Copper is easier, with buyers and sellers holding off, and lead and tin plate are rather weak under a very restricted demand. Speculation in securities has been narrow. The stock market is wholly in "professional" hands and investment business almost an absent quantity.

Natural Gas Consumption.

The United States Geological Survey has compiled and lately published some interesting figures in regard to the consumption of natural gas in the United States, which show that the amount of natural gas produced in this country is steadily declining. This is not attributed to lack of demand, but to a natural exhaustion of the supply. From a value of $22,600,000 in 1888, the quantity of natural gas used has steadily dropped, until last year it amounted to only $13,000,000 in value. These figures, however, do not adequately reflect the actual decline, as prices of the product were much lower prior to 1894 than they are now. Moreover, in the earlier days much of the gas was lost by leakage and careless management. Of late a closer watch has been kept on the condition of the pipe lines, and leaks which were neglected in former years are avoided, while methods for consuming the gas economically have been generally introduced. Of the quantity of natural gas used in 1896, Pennsylvania and Indiana furnished more than two-thirds, each State producing over $5,000,000 worth. In 1888 the Pennsylvania output was valued at $19,280,000, while Indiana's was only $1,320,000. Ohio, which stands third on the list of natural gas States, produced to the value of $1,500,000 in 1888 and $1,172,000 in 1896. West Virginia, the fourth on the list, is credited with producing $100,000 worth of natural gas in 1888 and $640,000 last year.

The proposal to erect a colossal statue of Tubal Cain near Pittsburgh appears to be something more than a newspaper *canard*. The matter, it is announced, has been taken up officially by the Engineers' Society of Western Pennsylvania and the local Foundrymen's Association, and the site for the suggested monument is reported to have been selected, in the Ohio River at the confluence of the Allegheny and Monongahela rivers. It is proposed to build the pedestal of the statue—which will rise from the water—of iron and steel and to place upon it a colossal bronze figure representing the Father of Metal Workers. No more suitable spot could be chosen in which to honor the memory of the tutelary genius of the great industry which has made the Pittsburgh region famous and wealthy. The position of the statue would be such that it would be viewed by all visitors approaching the Iron City.

The lightest known solid is said to be the pith of the sunflower, with a specific gravity of 0.028, or about one-eighth that of cork. The sunflower is extensively cultivated in Central Russia, and various uses are served by its different parts, the recent discovery of the lightness of the pith essentially increasing the commercial value of the plant. For life saving appliances cork has a buoyancy of 1 to 5, while with the sunflower pith 1 to 35 is obtained. About 800 cubic inches of it would weigh as much as 1 cubic inch of iridium, the heaviest metal.

THE LETTER BOX.

Removing Lime from Water Back.

From Plumber, Allentown, Pa.—The water in our town is of such a nature that a water back used with the ordinary kitchen stove will soon be filled with a deposit which destroys its usefulness and makes it necessary to replace the water back. I have accumulated a large number of these water backs and would like to know if there is any way in which the deposit can be removed readily. The water backs are as good as new, with the exception of the deposits, and are for stoves that are used in this vicinity, so that there would be a ready sale for them if they were cleaned out.

Note.—We shall be glad to hear from the trade in reference to this subject. In previous communications that have appeared in *The Metal Worker* it has been stated that common washing soda placed in a kitchen boiler and left under a mild firing for from one to three days will so soften the lime deposit that the circulation of the water between the water back and the boiler will wash the deposit into the boiler, where, by opening the sediment cock, the soda and dissolved accumulation may be run off. It is a well-known fact that washing soda is frequently used in steam boilers to remove the scale from the surface. With this information before us it seems reasonable that if the water backs in question were immersed in a large vessel filled with a strong solution of soda and water, and the water was kept at a temperature approaching the boiling point for several hours, the deposit would be sufficiently softened to be readily washed out. The experiment is simple, and in case there are a large number of water backs might be worth the trial.

Pattern for a "Y."

From S. S. R., Cambridge, Mass.—Please inform me through *The Metal Worker* how to draw a pattern for joining two pipes together as I show in the sketch, the main pipe to be 20 inches in diameter and reducing to two 10-inch pipes.

Note.—If our correspondent will consult Problem 207, Page 309, in "The New Metal Worker Pattern Book" he will find how to cut a pattern for a Y consisting of two tapering pipes joining a larger pipe at any angle, which we believe is exactly the problem he has in mind.

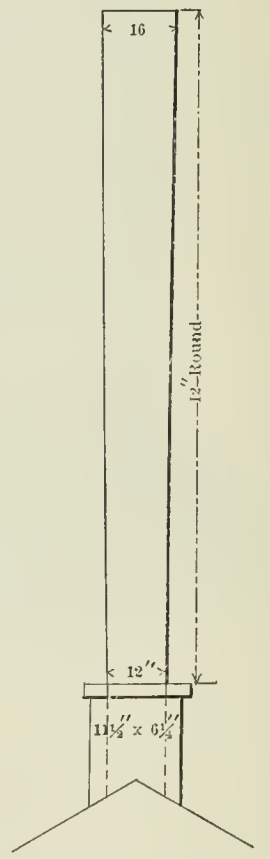
Freezing a Service Pipe.

From H. A., Philadelphia.—I have some work to do on a system where there are no means of shutting off the water supplied to a building, and would like to know if it is safe to stop the water by freezing the service pipe.

Answer.—If the service pipe is made of lead there is very little danger of bursting the pipe by freezing it when there is a chance for the water in the pipe to expand in both directions from the point where it is frozen. The work of freezing the pipe is comparatively simple, as are also the appliances that will be needed for doing it. The pipe can be frozen in from half an hour to an hour, depending upon its size and whether or not the water is running at the time freezing is attempted. If it is an ordinary pipe of ½ to ¾ inch diameter there will be very little difficulty. To freeze the pipe it is necessary to surround it with a mixture of ice and salt, and a simple and good way to keep this material in contact with this pipe would be to secure a small box of about 16 inches in length, 12 or 14 inches in width and about 12 inches deep. Saw notches in each end of the box about one-half of the depth of the box, and of sufficient width to slip over the pipe. The box should then be moistened with water and made water tight by being daubed with clay. The box should be placed in position around the pipe and firmly supported. The notches should be made water tight with the clay. Then by breaking the ice into quite small pieces, smaller than chestnut coal, and mixing with it a liberal sprinkling of coarse salt, such as is used in manufacturing ice cream, and filling the box with this, the freezing is only a question of time. It is a simple matter to tell when the pipe is sufficiently frozen to work by driving a small nail into the pipe to see if water comes out. If it still leaks water, the opening should be closed and more time given for the freezing mixture to act.

A Chimney Difficulty.

From H. W. Gazlay, Cortland, N. Y.—In answer to the inquiry of "J. K.," in reference to a chimney difficulty, which appeared in *The Metal Worker* of September



A Chimney Difficulty

25, you say the area of the chimney is 76 square inches, and I find that four openings for 6-inch pipes have the combined area of 112 square inches. It would appear that the difficulty is right here. The capacity of the chimney is too small for four 6-inch pipes. The proper thing to do is to build a chimney of sufficient capacity. I think the best way to assist the chimney is shown by the sketch herewith, using a tapering stack 12 feet high, 12 inches in diameter at the base and 16 inches in diameter at the top.

Pattern for a Lamp.

From W. E. B., Panther, Iowa.—I wish some reader of *The Metal Worker* would furnish a design and directions for cutting the patterns for a locomotive water gauge lamp, the body to be of Russia iron and trimmed with brass.

SHEET METAL WORK.

MAKING SQUARE PIPE.

BY PRACTICAL.

As the making of square pipe to be used as stacks for conveying hot air to upper rooms is considered by many a rather difficult job, the following description of a rapid and convenient method may be of interest to some of your readers. Provide bench at least 30 inches wide and 10 or 12 feet long, with iron strip 2 x ¼ inch let in flush with top and front edge. Strip to be straight on front

Making Square Pipe —Fig. 1.—Marking Out the Work.

edge, and fastened to bench with ¼-inch countersunk head bolts 2 feet apart. Also provide iron or steel bar 2 x 2 inches square and 12 feet long. Also two horses for supporting the same at a hight level with the top of bench. Then proceed as follows for making 3½ x 10 pipe.

Use 20 x 28 tin. Full weight IC answers every purpose for this size. Groove or double lock together (double lock is decidedly preferable) four sheets the 28-inch way,

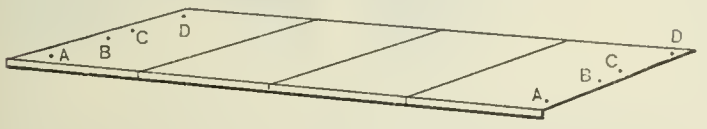


Fig. 2.—Turning the Edge

making what we will call a "strip" 28 inches wide and about 76 inches long. (From now on this method will require man and helper.) Lay strip on bench and with straight edge long enough to reach whole length of strip mark and trim one edge straight. At each end of strip prick mark as follows: From edge 3¾ inches, from this 10 inches, from this 3½, from this 10½, as indicated by AA, BB, CC and DD of Fig. 1.

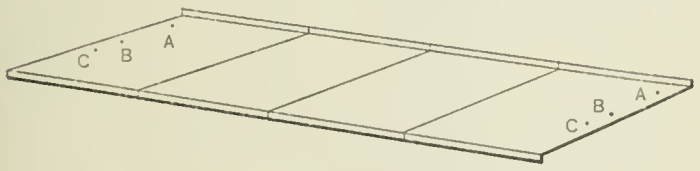

Fig. 3.—Turning the Edge on the Other Side.

Bring edge of strip ¼ inch over edge of bench and with mallet turn down square and smooth as in Fig. 2. Turn strip over. Mark and trim to marks DD. Bring over bench ¼ inch and turn down again as in Fig. 3. Turn strip over lengthwise so that the edge last turned will stand up at edge of bench. With mallet drive this edge over flat on some thin piece of iron (see Fig. 4), like a pipe gauge or rule, Fig. 4. Turn strip over so opposite edge will stand up at edge of bench and bring strip over edge of bench to marks AA and brake down square as in Fig. 5. Rub corner square and smooth with corner of mallet as shown in Fig. 6. Bring strip out to marks BB and brake again as in Fig. 7. Now remove the strip to bar and brake at marks CC. Turn the pipe thus formed so edge turned flat will hook over edge turned square as in Fig. 8. At this point see that pipe is not winding by sliding the edges one way or the other and then double seam the corner and you have a length of pipe completed 76 inches long. It will be noticed that one end of the

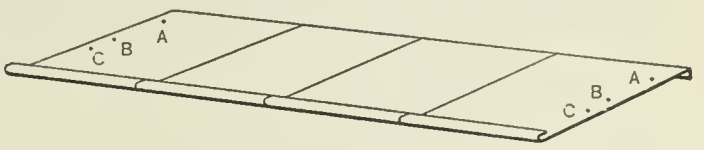

Fig. 4.—Edge Flattened Down.

bar extends over one horse far enough to enable one man to tip up the other end far enough to allow the other man to slide the pipe off the bar.

The above description applies to the making of any size pipe that can be made entire from the length of one sheet. When a size of pipe is required that one sheet will not make entire a little different method must be employed. Suppose a pipe 3½ x 11½ inches is required. A strip 28 inches wide made as described above will make three sides of this pipe, as follows: Square one edge and prick mark from edge 12 inches, from this 3½ inches, from

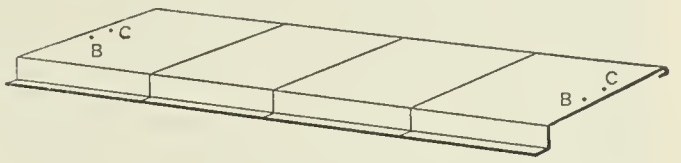

Fig. 5.—Making the First Bend of the Pipe.

this 12 inches. Square the other edge at last mark and turn both edges over flat and both the same way. Turn strip over so edges will be down. Brake square at first marks. Remove to bar and brake at remaining mark, and you have three sides of required pipe. For the other side groove together strip 4 inches wide and of the length of the pipe. Before grooving together turn with folder on both sides and both the same way a ¼-inch edge up square and lay the strip on the bar with the edges up Hook the edges of the unfinished pipe over the edges of the strip and double seam the corners and the pipe is finished.

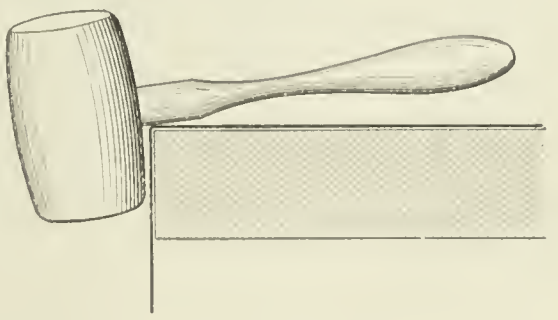

Fig. 6.—Using the Mallet to Finish the Bend.

This method will cover any size of pipe that the length of one sheet will make three sides of the pipe. If a 5 x 12 inch pipe is required, 9-inch pipe stock, which is 29½ inches, will make three sides of a 4¾ x 12 pipe, which will always answer. If a 6 x 12 pipe is required groove together three sheets of 20 x 28 tin the 20-inch way, making a strip 20 inches wide and 83 inches long. Square and trim

one edge and mark from edge 6¼ inches, and from this 12½ inches. Turn edge down square. Turn strip over and turn this edge over flat and opposite the other. Brake at remaining mark so that edge turned flat will be inside and you have two sides of the pipe. Take two such pieces to the bar and double seam the corners that match and the pipe is finished. It will thus be seen that these three methods will cover any size pipe that may be required, which can be made from the regular size tin with small waste, if any, and with a little practice will be found to be made rapidly. Furthermore, they are a convenient length to handle and two of them will make a stack.

There are several ways of connecting the lengths together, but I think the best way is as follows : From the scrap tin cut strips 2 inches wide, then with folder turn narrow edge on both sides and the same way and press flat. From these cut pieces in lengths to correspond with the widths of the four sides of the pipe, which strips we

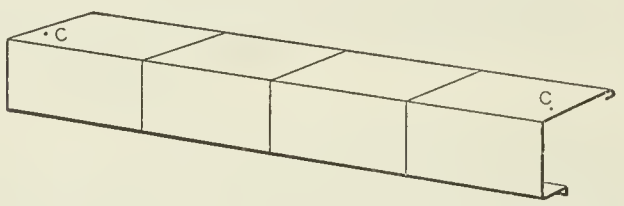

Fig. 7.—Making the Second Bend.

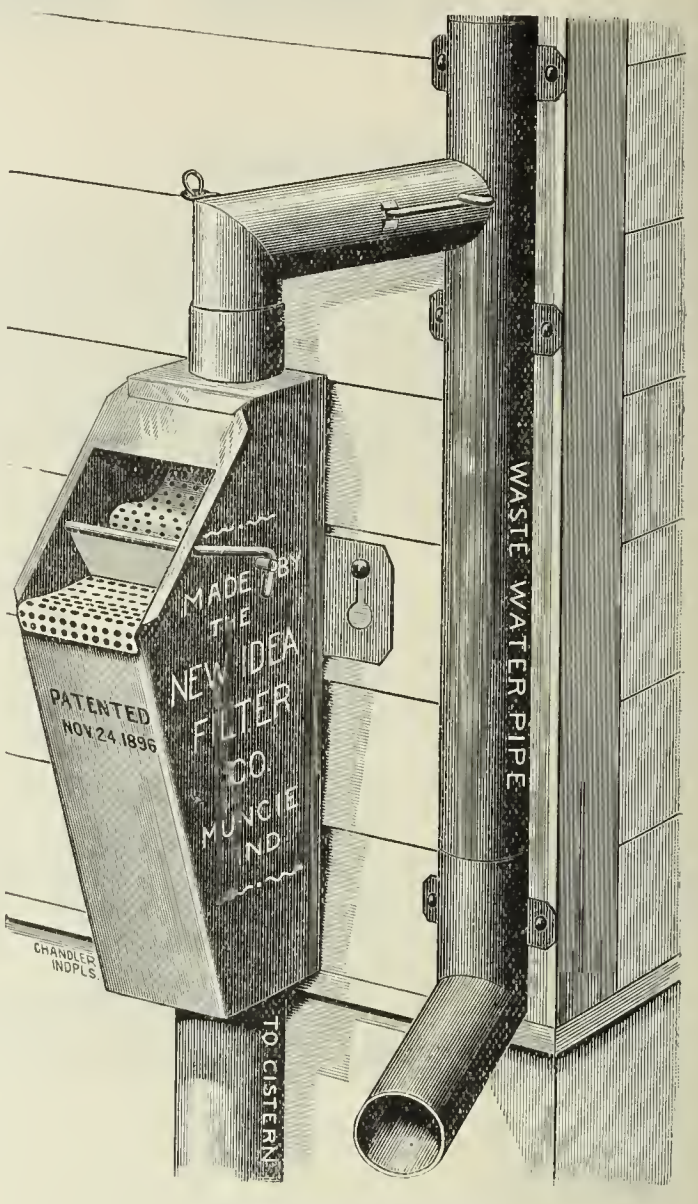
will designate as wings. Cut a V-shaped notch about 1 inch deep in each corner of one end of the pipe and rivet on the wings, using three rivets for the long ones and two for the short ones. Before riveting see that the wings are about ¼ inch from the end of the pipe. Have the rivets close to the lower edge of wing and below the notch in the pipe. When two lengths of pipe are to be put together the notches in the corner of the pipe will allow the pipe to be pressed in sufficiently to allow the end of the other length to slide over and between the pipe and wing, after which it may be soldered if desired, making a tight and strong connection. One end of each length should be provided with wings; the fittings also, such as elbows, tees, offsets, &c., should have these wings on one end for connecting to the pipe when required.

The new rolling mill company who are the outgrowth of the strike at the Scottdale Iron & Steel Company's plants were organized at Scottdale, Pa., this week. The capital of $125,000 has all been raised, and the first assessment of 20 per cent. has been paid in. The Board of Directors consists of A. L. Keiser, J. W. Ruth, A. C. Overholt, J. S. Parker, M. A. McCombs, P. F. McCann and James A. Bennett. All of the directors are from Scottdale and Greensburg. A. B. Pickard, cashier of the First National Bank of Scottdale, has been elected treasurer of the new company. The directors will meet and elect officers at an early date, as it is desired to begin work on the new plant as soon as possible.

The New Idea Rain Water Filter.

In the accompanying illustration we show the New Idea rain water filter, put on the market by the New Idea Filter Company of Muncie, Ind. This filter is designed



The New Idea Rain Water Filter.

for use in connection with a rain water conductor to filter the water and prevent dust and other refuse that accumulates on the roof in dry weather from being carried into the cistern in case of rain. In use a rain water cut off should be provided in the conductor pipe, one end connecting with a filter and the other connecting with an open elbow for the discharge on the surface of the ground. The construction of the filter is such as to permit the water to run into it freely, and any dirt that may be carried into it is collected on a perforated grating without making a splashing or overflowing. A gate is provided that is automatic in its operation, preventing the overflow of water and raising on the accumulation of leaves or other matter, so as to permit its discharge by the force of the

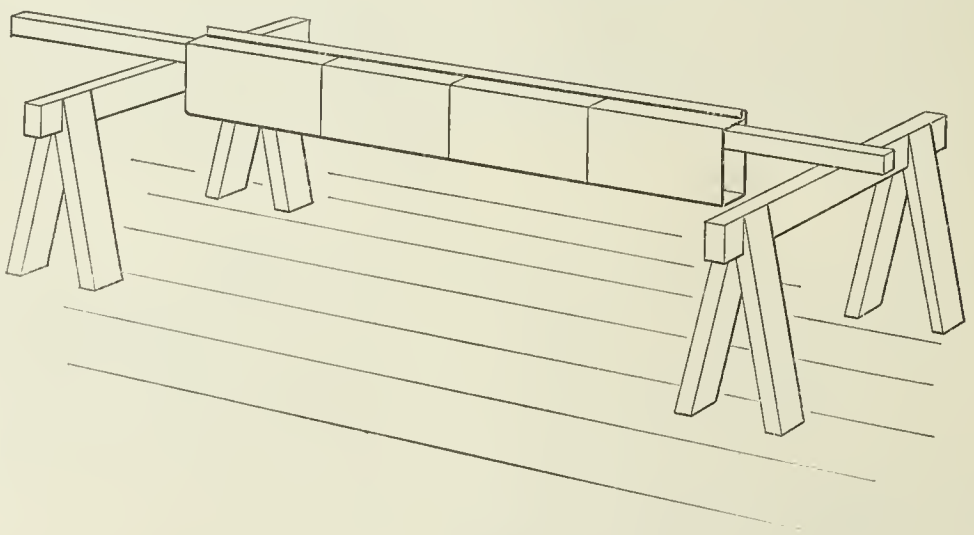


Fig. 8.—Finishing the Pipe.

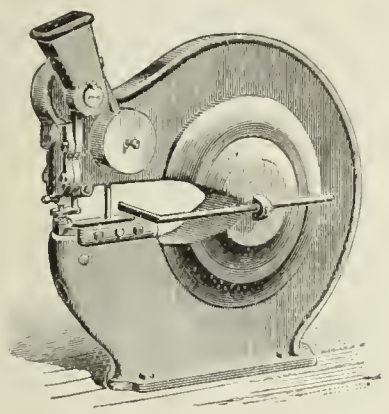
water. After the water has passed through the first grating it is again filtered by passing through a finely perforated cylindrical pipe or tube, the top of which is high enough to prevent the overflow of refuse into the cistern, an outlet for the overflow being provided through the perforated plate shown in the cut. The filters are made for 3, 4 and 5 inch conductors, and have been used with satisfaction by a number of persons, as attested by testimonial letters from them presented in the circulars of the company.

General Purpose Punch.

The accompanying illustration shows in its improved form the general purpose lever punch made by Bertsch & Co., Cambridge City, Ind. These punches, which are made in five sizes and adapted to power if desired, are for sheet iron workers, boiler makers, railing makers, carriage shops, wagon shops, &c. They will punch holes near the edge of angle and flange iron or around the edge of a 5-inch pipe or ring, the lever working from front or back. The eccentric is steel, likewise the plunger, eccentric yoke and box. There are three sets of quick adjusting dies and punches, and back and side gauges for punching holes equal distances apart without marking off. A mark on the work can be easily seen, as the stripper or take off is placed behind the plunger and is so arranged that it affords all the light possible. These tools, it is stated, will easily punch a ½-inch hole in ⅜ iron, as the eccentric has a short movement which makes a very powerful punch. The machine is now made with the punch plunger bearing and die seat adjustable, these features, it is pointed out, adding much to the life of the machine and decreasing the liability of chipping and breaking punches. Any lost motion in the plunger bearing can be easily taken up and the die seat adjusted so the punch will always enter the die centrally. The machines are made with from 4 to 24 inch throat for light or heavy work and special sizes for punching ½-inch holes in ½-inch iron.



General Purpose Punch

Aluminum for Packing Purposes.

In his comprehensive paper on "The Utilization of Aluminum in the Arts," recently read before the Franklin Institute of Philadelphia, President Alfred E. Hunt of the Pittsburgh Reduction Company remarked as follows regarding the use of this metal for the purpose of packing food products, a field in which aluminum seems to have a promising future :

In the great continental scourges that have played such havoc in far away parts of the world during the past year—the rinderpest in Africa, the famine and plague in India, as well as in the war between China and Japan—aluminum has played an important alleviating part in the form of metallic covers or cases for compressed foods hermetically sealed in oil paper packages. These cases not only form serviceable light covers to protect the food and allow of its rapid distribution in the afflicted districts, but also serve as convenient dishes in which to heat and cook the food at the time of its consumption.

A novel use for aluminum, which is likely to become quite a large one, is in tea caddies or boxes for the shipment of tea from the far away countries of China, India, Japan and Ceylon, where the tea is grown. The common practice now is to ship tea in wooden boxes, lead lined and sealed in specially prepared paper. Tea boxes are now being made of thin aluminum sheets about 5-100 inch in thickness, weighing about seven-tenths of a pound to the square foot, the sheets being riveted together in water tight boxes of the metal, with angles at the inside corners for holding the riveted joints together. The aluminum sheets are given a satin finish on the outside to allow the special printing and marking of the boxes as desired by the tea merchants. These aluminum tea boxes are lighter and cost but little more than lead lined wooden boxes that have heretofore been used.

American versus English Hoops.

Some interesting comparative tests of American and English hoop iron were recently conducted in behalf of a consumer in South America. The results of the tensile tests are shown in the following table:

	Standing strain. Pounds, English.	Elongation.
English hoop, 1 single piece of.....0.605m.	2,884	0 015
N. American hoop, 1 single piece of.....0.605m.	4.032	0.020
English hoop, 2 pieces with rivet.....0.605m.	2,724	0.010
N. American hoop, 2 pieces with rivet.....0.605m.	3.416	0.015
English hoop, 2 pieces with 2 rivets.....0.69m.	2,836	0.015
N. American hoop, 2 pieces with 2 rivets..0.605m.	3,668	0 035

The ends of the pieces had to be bent to get them into the machine, with the result that the English hoop broke, whereas the American hoop bent without breaking ; moreover, the English hoop gave away at the ends, the American hoop in the middle and at the rivets.

The following are recent tests of American hoops, also made by a consumer who uses them abroad:

Breadth.	Thickness.	Tension in pounds. Maximum.	Tension in pounds to square inch.	Elongation in inches.	Percentage of elongation.
1 31/64	0.076	8,300	73,500	24/16	25 0
1 31/64	0.078	8,400	72,500	20/16	20.8
1 31/64	0.076	8,300	73,500	23/16	23.9
1 31/64	0 076	8 200	72,600	16/16	16.6
1 49/64	0.076	10,400	77,500	22/16	22.9
1 48/64	0.077	10,500	77,900	25/16	26.0
1 49/64	0.077	10,400	76.4 0	15/16	15.6
1 49/64	0.077	9,500	69,800	20/16	20.8

These hoops were made and shipped by A. R. Whitney & Co.

Electrolytic Corrosion of Water Pipes.

The following report concerning the electrolytic corrosion of water pipes, &c., caused by the current from the electric railways was made by E. B. Ellicott, superintendent of the City Telegraph Department of Chicago:

I have had an examination made of the ground return of the street railway company operating an electric railway line on South State street, with the following result: At the corner of Fifty-first and State streets a test was made between a 30 inch gas pipe and the rails of the street railway company. It showed there was a current of 25 amperes flowing from the pipes to the rails at a point where this large main was intersected with a 7-inch gas pipe at Fifty-first street. In the block between Fiftieth and Fifty-first streets there was found to be a difference of potential of three volts between the hydrant and the rails and a current flow of 16 to 20 amperes. Between Fifty-first and Fifty-second streets, near which latter street is located the power house of the street railway company, there is a gradual decrease in current flow, which shows that the ground return at a point on Fifty-first street and State street is very poor.

The railway company should be required to run the proper return wires from this point in order to decrease the flow of current from the pipe to the rails. The 6-inch gas pipe which was removed was found to be very badly pitted from the action of the current, and it is no doubt affecting the water mains in this vicinity and at other points along the line which have not as yet been tested.

The difference of potential between the rails and the gas and water pipes should be reduced to practically nothing in order to prevent the deterioration of the pipes. I do not know of any other way of securing this result, except to run the proper sized copper return cables and make connections to the rails at such points that it will prevent the flow of current between the pipes and the rails, or to connect the pipes to the rails at different points along the line and give the current a path to the rails through a good connection.

I would not want to recommend this latter method without first making some very careful and extended tests. There is no doubt that within the next year or two it will be necessary to replace many of the water mains, owing to their being affected by carrying the street railway return current, and I am of the opinion that a complete test should be made of all the street railway lines which parallel water mains with a view of determining where the dangerous points are, and that the railway companies be required to remedy the defects in the return conductors.

I would suggest that a competent man be detailed for this work and the tests be made at an early date in order that the railway companies may have an opportunity to correct the defects before winter. The test above referred to was made with a representative of the South Chicago City Railway Company present, and their reports will probably show the same results as above given.

HEATING AND PLUMBING.

Plumbing Ordinance of Peoria, Ill.

We conclude this week the publication of the plumbing ordinance of Peoria, Ill., commenced in our last issue :

ARTICLE III.

Section 1. That the construction, maintenance and control of the plumbing, drainage and ventilation of all buildings in the city of Peoria, Ill., shall hereafter conform to and comply with the following rules and regulations—viz.:

PLANS OF PLUMBING.

Sec. 2. Before the construction, reconstruction, alteration or repair of any portion of the plumbing and drainage system of any building where the amount will exceed $50, suitable plans, specifications and descriptions of all work proposed to be done shall be presented to the Plumbing Inspector by the architect or by the owner or agent of the property. Such plans, specifications and descriptions, after examination, shall be marked "approved" or "rejected" and returned to the owner.

Sec. 3. All plumbing plans and sections shall be drawn to scale and shall show clearly the location of every pipe, fixture and trap, and the ventilation of rooms in which plumbing fixtures are to be placed. Plans must be drawn in ink on heavy paper or on tracing cloth 8 x 12¼ inches or 16 x 12¼ inches in size.

Sec. 4. One vertical drawing is sufficient for a building when it can be made to show all the work ; if not, others must be submitted. Where a number of buildings are situated together on one street, and the plumbing is the same in each, one plan will be permitted for all the buildings. In such a case a general plan must be submitted, showing all the houses and the location of the main drain for each house. Every plan must be accompanied by a clear, written description thereof, or abstract of the specifications.

Sec. 5. Plans and specifications will be approved or rejected within a reasonable time from the date of filing. In case of disapproval the person filing the plan will be notified in writing of the reasons for such disapproval.

Sec. 6. No portion of the plumbing or drainage work on any building shall be executed until the above mentioned plans and descriptions thereof shall have been approved by the Plumbing Inspector.

Sec. 7. These regulations shall also apply to any extensions or alterations of existing systems. In such cases a plan of the old system, together with a plan of the proposed changes, must be filed in the office of the Plumbing Inspector.

Sec. 8. All approved plans, drawings, specifications or descriptions shall be permanently marked "approved," and signed by the Plumbing Inspector. The said inspector shall also issue a certificate of approval, which shall be made in book form, well bound and numbered in duplicate from one upward. These duplicates shall be signed by the Plumbing Inspector, one of which shall be delivered to the person, firm or corporation filing the plans, specifications and descriptions, and the other to remain undetached in said book in the office of the inspector, to be retained for any future use or reference by the city.

Sec. 9. If the work is not begun under the approved plans within six months from the date of approval, such plans must be again presented for approval. Plans are approved under condition that such approval expires by its own limitation within six months from the date of approval ; and where one plan has been submitted for more than one building, this rule shall apply as to each of said buildings as if said plan had been filed for such building only.

Sec. 10. No change or modification of the approved plans will be permitted unless such change or modification be authorized by the owner or agents, submitted to the Plumbing Inspector, and approved and placed on file as in the case of original work.

Sec. 11. The Plumbing Inspector shall keep in suitable form a record of all plans and specifications examined by him, whether approved or rejected, and whether for new buildings or of old system inspected and examined by him, and shall as soon as possible complete the record of the plumbing or want of plumbing, sewer connections, &c., in each building in the city, with such explanations and notes appended thereto as will enable future boards or inspectors to trace sources of filth and causes of sickness, enforce the best sanitary conditions, and to preserve the public health without re-examination or inspection of plumbing, drainage and ventilation.

OLD PLUMBING.

Sec. 12. Whenever it shall come to the knowledge of the inspector, or complaint in writing shall be made by two citizens, that the plumbing in any building causes a nuisance, or is contrary to the ordinances of said city, or is of faulty construction and liable to breed sickness or disease, or endanger the health of the occupants ; or upon the request of any owner or occupant of any building fitted with plumbing prior to the passage of this ordinance, to the Commissioner of Health, then said Board of Health shall direct the Plumbing Inspector to examine the plumbing in any such building, and such inspector shall make a drawing of the plans of said plumbing, drainage and sewer and ventilating shaft connections. He shall report his findings in writing to the Board of Health and suggest such changes as are necessary to make the same conform to the rules governing these matters. The Board of Health shall then notify the owner or owners, agent or occupant of any such building of the changes which are necessary to be made in the plumbing. These changes shall be made within a time fixed by said board, and upon a refusal or neglect to obey such orders the board shall proceed to have such changes made and such nuisance abated and recover the expense from the owner or occupant of said premises.

INSPECTION WORK.

Sec. 13. The Plumbing Inspector must be notified when the work is begun and when any work is ready for inspection by the plumber doing the work. All work must be left uncovered and convenient for examination until inspected and approved. No notice shall be sent for an inspection until work is entirely ready for thorough inspection. In case of any violation of this regulation, the approval of said plans may be at once revoked by the Plumbing Inspector, and upon notice of revocation being given all work on said plans must cease.

Sec. 14. The Plumbing Inspector will examine the work within two working days after notice that it is ready for inspection has been received. All plumbing when placed in position must be tested by the water test in the presence of the Plumbing Inspector, and all defective joints made tight. Defective pipe must be removed and replaced with sound pipe. When the entire plumbing work is completed, and before it is used, it must be tested by peppermint, or other practical test, in the presence of the Plumbing Inspector, and upon satisfactory completion of said work the Plumbing Inspector shall issue a certificate of approval.

HOUSE DRAINS.

Sec. 15. All soil, waste and vent pipes shall be of cast iron, galvanized wrought iron, lead or brass. No brick, earthenware or sheet metal pipe shall be used in any part of the plumbing or drainage system within a building or for ventilation pipes ; chimney flues shall not be used for ventilators. All cast iron pipes shall be thoroughly coated, inside and out, with coal tar or pitch, applied hot by immersion. Such pipe shall be of uniform thickness, free from holes, cracks or other defects, and shall have an average weight of not less than specified below :

2-inch pipe, 5½ pounds per lineal foot.
3-inch pipe, 9½ pounds per lineal foot.
4-inch pipe, 13 pounds per lineal foot.
5-inch pipe, 17 pounds per lineal foot.
6-inch pipe, 20 pounds per lineal foot.
7-inch pipe, 27 pounds per lineal foot.
8-inch pipe, 33½ pounds per lineal foot.

Sec. 16. All fittings used in connection with cast iron pipe shall be of corresponding weight and quality ; fittings for galvanized wrought iron pipe to be of galvanized malleable iron.

Sec. 17. When lead pipe is used for waste or vent pipes it shall have a weight of not less than specified as follows :

1-inch pipe, 2 pounds per lineal foot.
1¼-inch pipe, 2½ pounds per lineal foot.
1½-inch pipe, 3½ pounds per lineal foot.
2-inch pipe, 4 pounds per lineal foot.
3-inch pipe, 5 pounds per lineal foot.
3½-inch pipe, 6½ pounds per lineal foot.
4-inch pipe, 8 pounds per lineal foot.

Where lead pipe is used to connect fixtures with soil

or waste pipes, or to connect traps with vent pipes, such branches shall be as short as possible. All wrought iron pipes shall be galvanized, of standard weight, and shall be lap or butt welded with screw joints.

Sec. 18. All joints in cast iron pipes, drain pipes, soil pipes and waste pipes shall be so filled with oakum and lead, and hand calked, as to make them gas and water tight. Wrought iron pipes shall be connected by means of proper couplings with screw joints, cemented with red lead All connections between lead and cast iron pipes shall be made with suitable brass or lead furrules of the same size as the lead pipe, put in the hub of the branch of cast iron pipe and calked with lead, the lead pipe to be attached to the ferrule by means of a wipe joint.

Sec. 19. Wrought iron pipes shall be connected with lead pipes by means of a brass soldering nipple wiped to the lead pipe. All connections of lead, waste and vent pipes shall be made by means of wipe joints. Where wrought iron pipe is connected with cast iron pipes the cast iron fitting must be tapped and the connection made by a screw joint.

Sec. 20. All drain, soil, waste, vent and supply pipes shall be as direct and concentrated as possible, protected from frost and readily accessible for inspection and convenience in repairing. When necessarily placed within partitions or recesses in walls, soil and waste pipes must never be covered except with wood work, said wood work to be fastened with screws (never nails) so as to be readily removed.

Sec. 21. The least diameter of soil or drain pipe permitted is 4 inches. A vertical waste pipe into which a line of kitchen sinks discharges shall be at least 2 inches in diameter, if receiving the waste of five or more sinks, and shall have 2 inch branches.

Sec. 22. All changes in direction of cast or wrought iron pipes shall be made with curved fittings ; all connections shall be made with Y branches and one-sixteenth or one-eighth bends, if possible, and sanitary tees.

Sec. 23. Every vertical soil, vent and main waste pipe shall extend at least 2 feet above the highest part of the roof or coping, except in the case of flat roof tenement houses, in which it shall extend at least 6 feet above the roof, and said pipe shall have a diameter above the roof at least 1 inch greater than the pipe proper, but in no case shall it be less than 4 inches in diameter above the roof. No cap or cowl shall be affixed to the top of such ventilation pipe, but a strong wire basket shall be provided and securely fastened thereto. Each length shall be securely fastened, and in case of each line of soil pipe it shall rest at its foot upon a pier or a foundation to prevent settling.

Sec. 24. Whenever the roof of a building in which soil or ventilation pipes are being placed is found to be below the one adjoining it, these pipes must be extended 1 foot above the highest roof, according to direction of the Plumbing Inspector.

VENTILATION.

Sec. 25. If soil or waste pipes are placed in buildings for future use, the necessary ventilation pipes shall also be put in and the work tested and inspected as if for immediate use. All openings not in use shall be closed by plugs screwed or calked in.

Sec. 26. The house drains within the building shall be securely hung on the cellar walls or the cellar ceiling, unless this is impracticable, in which case they must be laid in an open trench with a fall of at least ¼ inch to the foot, and more, if possible. The drain shall not be buried in the cellar bottom, except by special permission of the Plumbing Inspector. The main drain shall be provided with openings for cleaning purposes, the same to be closed by brass screw plugs.

Sec. 27. Overflow pipes from traps must in each case be connected on the inlet side of the trap to the same fixture. The overflow pipes from tanks and waste pipes from refrigerators or other receptacles in which provisions are stored shall be properly trapped, and shall discharge into an open water supply fixture.

Sec. 28. All vertical lines of soil pipes must have a clean out at the foot of the line. Where the direction of soil pipe or waste pipe is changed, clean out connections must be placed ; also at the end of each horizontal line and each junction. All clean outs shall be of the same diameter as of the pipe into which it is inserted, and be of heavy cast brass at least 4 inches long with air tight screw joints. All clean outs shall be calked into the iron pipe with molten lead and picked oakum.

Sec. 29. All openings in soil, sewer, drain, waste, supply and ventilation pipes must be closed by plugs, screwed, calked or wiped in.

Trap screws must be placed on the ends of all lines of waste pipe having more than one fixture attached to it on the same floor, and on the end of all horizontal lines.

TRAPS.

Sec. 30. Every water closet, urinal, sink, basin, wash tray, tub or set of tubs and hydrant waste pipes, and all other fixtures, shall be separately and effectively trapped. Urinal platforms, if connected to drain pipes, shall also be properly trapped, and a supply of water so arranged as to always maintain the seal of said traps. In no case shall the waste from the bathtub or other fixture be connected with a water closet trap. Traps shall be placed as near the fixtures as practicable, and in no case shall a trap be more than 2 feet from the fixture ; each and every trap shall be provided with suitable accessible openings for cleaning purposes.

Sec. 31. There shall be no trap placed on vertical soil and waste pipes. Traps must be protected from siphonage and the waste pipe leading from them ventilated by a special air pipe, in no case less than 2 inches in diameter for water closet traps and 1½ inches for other traps.

Sec. 32. These vent pipes must open into a vertical ventilating pipe at least 3 inches in diameter, increasing in area as it passes upward to correspond with the combined area of all branch vents passing into it, and extending above the roof, as herein provided ; or they may open into the soil pipe extension above all fixtures.

Sec. 33. Slop sinks, kitchen sinks and pantry sinks in all restaurants, hotels, eating houses and boarding houses must be provided with and connected to a grease trap or catch basin of approved pattern.

WATER CLOSET.

Sec. 34. No water closet shall be supplied directly from the house supply pipe, but shall be supplied with water from a special tank or cistern not used for any other purpose, and shall in all cases be separately and independently connected with the general or common drain pipe of the house. The flooding pipe shall not be less than 1¼ inches in diameter.

Sec. 35. All water closets shall be located in a well ventilated apartment, with a window of suitable dimensions leading directly to the outer air. The space in and around the water closets and wash bowls shall not be inclosed by wood work, but shall remain open and exposed to view. A group of closets may be supplied from one tank, but water closets of different floors shall not be flushed with water from one tank.

Sec. 36. All joints between the water closet and soil pipe shall be made by means of brass connections, properly soldered to lead soil pipe and united to closet by a rubber gasket. No saddle hubs shall be used. A proper floor flange of brass, at least ¼ inch thick, and securely soldered to lead bend, shall be used in setting water closets, and rubber gasket with two or more ribs extending above it placed between the flange and closet. Cast iron traps shall have lead calked joints.

Sec. 37. No pan or plunger closet shall hereafter be placed in any building, nor shall any old pan of plunger closet be replaced by a new one, nor shall any hopper closet be placed in any building except in case of an outside water closet.

Sec. 38. In tenement houses there shall be a separate water closet for each family. One outside water closet shall not be used by more than two families. In no case will a water closet be allowed in the cellar or basement of a building without a special permit from the Board of Health.

CELLARS.

Sec. 39. Where pipes pass under the walls of a house there shall be a relieving arch to prevent the pipe being broken by the settling of masonry. Cellars shall be drained by means of suitable, properly laid earthenware tile pipes. A running trap or trapped basin shall separate the cellar drain from the house drain or sewer. Cellar and foundation walls shall be rendered impervious to dampness, and sub-soil drains must be provided when necessary.

Cellars and areas shall not be connected with the house drain unless absolutely necessary. If connected with the house drain, they must be properly trapped and water supply sufficient provided to maintain the seal at all times.

RAIN WATER LEADERS.

Sec. 40. Rain water leaders will be allowed connected to the house sewer only when special permission is obtained from the Plumbing Inspector. When within the house, the rain water leader must be of cast iron with leaded joints or galvanized wrought iron. The rain water leaders shall never be used as soil pipe, waste pipe or vent pipe, nor shall any soil, waste or vent pipe be used as a leader. When outside of a house, and connected with the house drain, it must, if of sheet metal, with slip joints, be trapped beneath the ground or just inside the wall, the trap being protected from frost.

Sec. 41. In every case where a leader opens near a window or a light shaft it must be properly trapped at its base. The joint between an iron leader and the roof must be made gas and water tight, preferably by means of a brass ferrule and lead or copper pipe properly soldered.

STEAM PIPES.

Sec. 42. No steam exhaust or blow off pipe shall be connected with any private drain or sewer which is connected with any public drain or sewer. Such pipes shall

discharge into a tank or condenser, approved by the City Engineer, the waste from which, if discharged into the sewer through the house drain, shall be connected on the sewer side of the running trap.

Sec. 43. That the provisions and regulations contained in the foregoing rules, together with such instruction as the Plumbing Inspector may deem proper, shall extend over and govern the construction. reconstruction, maintenance, alterations and repairs of plumbing, drainage and ventilation of all buildings in the city of Peoria, and to a point 4 feet outside of the walls of the same.

Sec. 44. Any person, persons, firm or corporation who shall violate any one of the provisions of this ordinance, or who shall fail or neglect to comply with any of the foregoing rules and regulations, or who shall fail or neglect to comply with any of said provisions, rules, orders or regulations in this ordinance contained, shall be guilty of a misdemeanor and on conviction thereof shall be fined in any sum not exceeding $100 for each offense, and if the guilty party be a licensed plumber the Mayor of the city of Peoria, on written notice thereof, shall revoke such license.

ARTICLE IV.—PLUMBERS' LICENSE—PENALTY.

Section 1. No person, firm or corporation shall carry on the business of plumbing within said city of Peoria without having first obtained a license therefor, under a penalty of not less than $20, nor more than $200 for each offense.

LICENSE FEE.

Sec. 2. Licenses shall be granted to practical plumbers holding a certificate issued by a duly qualified Board of Examiners within the State of Illinois, upon the payment of $10 per annum.

APPLICATION FOR LICENSE.

Sec. 3. Application for license shall be made in writing to the Mayor. It shall state the full name of the applicant, his place of residence, his existing or proposed place of business, and the firm name under which the business is to be carried on, and the name of each member of any firm.

BOND—CONDIT ON.

Sec. 4. Before any license shall be granted to any person to carry on the business of plumbing he shall execute a bond to the city of Peoria, with two or more sureties, to be approved by the Mayor, in the sum of $5000, conditioned that he will indemnify and save harmless the city of Peoria from all accidents or indemnities caused by any negligence in either the execution or protection of his work, or from any unfaithful or inadequate work done under or by virtue of his license ; and that said license shall also conform to all the conditions and requirements of the city for his government, and in default thereof will submit to such penalties as are or may be prescribed by the City Council.

LICENSE POSTED—CHANGE OF FIRM.

Sec. 5. Any change of the firm name or location of business must be promptly reported to the Plumbing Inspector, and the license shall be kept in a conspicuous place at the place of business.

LICENSE NON-TRANSFERABLE.

Sec. 6. When two or more persons are copartners, licenses shall be issued in the name of the firm or copartnership, and no license shall be transferable.

HOUSE PLUMBING AND DRAINAGE.

Sec. 7. All plumbing and drain work in any house, or connected therewith, shall be subject to the inspection, supervision and approval of the Plumbing Inspector.

PENALTY.

Sec. 8. Any plumber who shall be guilty of any violation of any of the provisions of this article, or any of the ordinances of the city relating to the conduct of his business as such plumber, shall forfeit his license and shall be subject to a fine of not less than $10 nor more than $100.

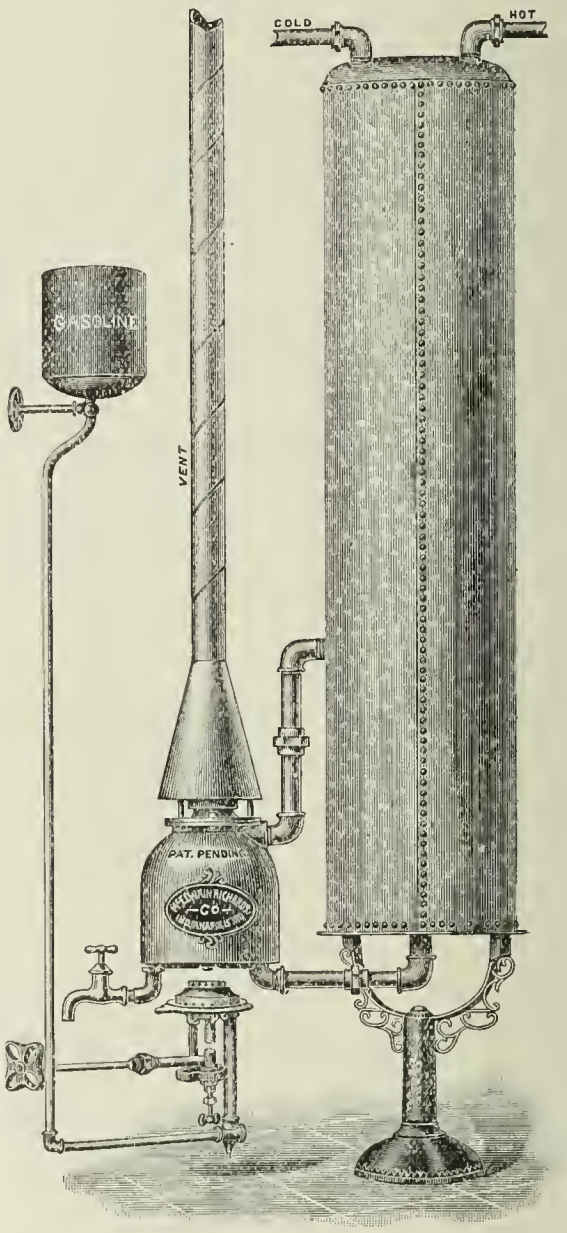
Sec. 9. All ordinances or parts of ordinances now in force in any way conflicting with the provisions of this ordinance and not contained herein shall be and the same are hereby repealed.

Sec. 10. This ordinance shall be in force from and after its passage and due publication thereof, as required by law.

We have received through the courtesy of S. L. Beidler of Mount Pulaski, Ill., circulars describing the Eagle Automatic Acetylene Gas Generator, made by Walmsley & Co., 732 Marquette Building, Chicago, Ill. Judging from the views presented in the circular the machines are made in several different sizes and capacities, the reservoirs for the gas being separated from the chamber in which the carbide is stored. With the circular comes a sheet of testimonial letters from a number of persons who have used them in residences, stores and hotels for several months, and stating that their use has been satisfactory and the expense light, that they are simple to operate, and require but little attention.

Williams Water Heater.

We show in the accompanying illustration the Williams water heater manufactured by McElwaine & Richards, Indianapolis, Ind. The heater consists of malleable iron castings, made in parts and connected together by means of flanged joints, so that they can be taken apart for cleaning when used in connection with hard water and a lime deposit accumulates. The connections are such as to readily stand a high pressure of water. A flue runs up through the center of the heater to increase



Williams Water Heater.

the heating surface and to carry off the products of combustion from the burner used in connection with it. Openings are provided at the side for connecting with the ordinary kitchen boiler, and another opening is provided for a sediment cock. Burners for using either natural or artificial gas and a special form of gasoline burner, are provided for use in connection with it. It is claimed that with this water heater the burners do not become clogged by moisture from condensation in the heating chamber. It is pointed out that the water can be heated very quickly with a small expenditure of fuel and that the vent pipe insures that there will be no odor in the house. The instructions given are that the burners should be placed 2 inches below the bottom of the heater and the vent pipe should be connected with the chimney direct or with pipe from any stove that may be used. The heater should be set on a level with or below the bottom of the boiler to insure good circulation. With this water heater it is possible to have a supply of hot water in a short time without building a fire in the kitchen range, which is looked upon as a feature of special interest for summer use.

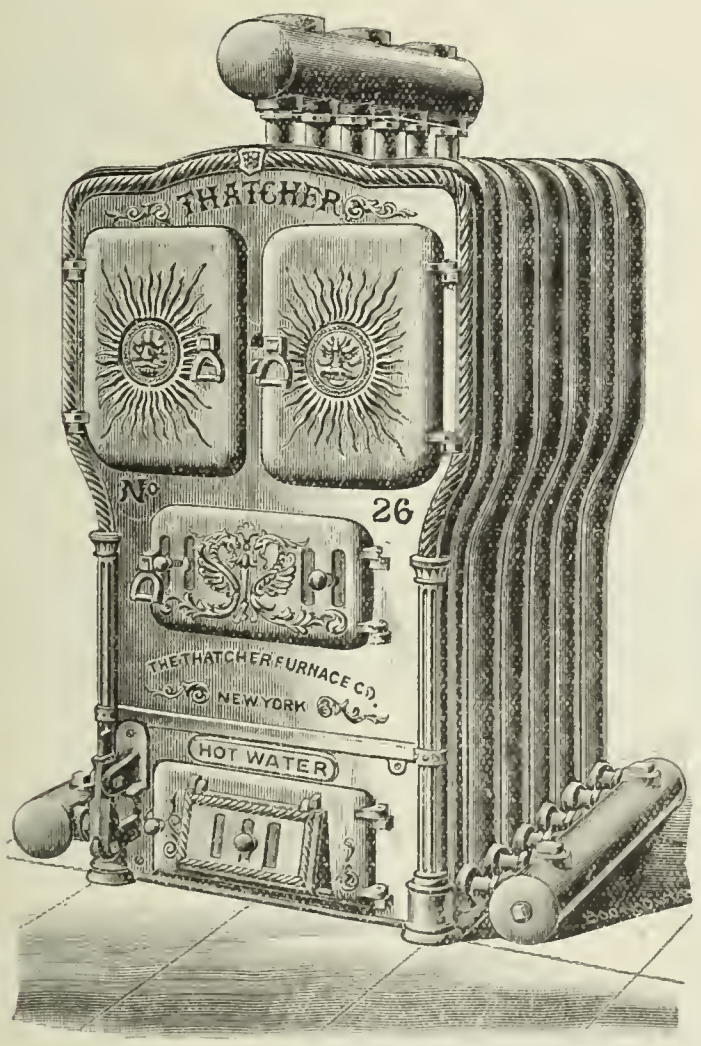
Atlanta, Ga., is somewhat exercised at present over the threatened destruction by corrosion of the city water mains, due to heavy underground electric currents. A local engineer who investigated the condition of the pipes

supplying his dwelling found that in a number of places the pipe showed a disposition of the water to "weep" through and leak and also that the pipe carried a current sufficient to run 20 incandescent lamps.

The Thatcher Steam and Hot Water Heaters.

The newest production in the line of steam and hot water heating apparatus turned out by the Thatcher Furnace Company, 240 Water street, New York City, is the Thatcher boiler shown in the accompanying illustrations. This boiler bears the name of Thatcher, and is presented by the company as a representative of the best type of the modern heater. A general view of the heater is shown in Fig. 1, from which it is readily seen that it is of attractive desigu and commanding appearance. In Fig. 2 a view of the heater is presented with the necessary trimming for use as a steam boiler, the doors being opened so that the construction and fire travel will be understood in connection with the following description: The boiler is of the vertical sectional type, connected at the top and on each side with headers by means of screw nipples, so that all joints are on the outside and any leaks can be detected and stopped. The water leg portion of the section forms the sides of the ash pit and of the fire chamber, and is provided with supports for a labor saving grate designed to be operated by means of a lever from the front. The ash pit is provided with a door for removing ashes, aud also has a draft door adapted for automatic regulation iu conection with the automatic damper regulator furnished with the heater.

In addition to the heating surface in the water leg section the construction affords a large expanse of surface by the arrangement of the crown sheet, which may be said to have an upper and lower surface. The lower surface is that which hangs directly over the fire, and by means of spaces between the sections, due to the tapering form



The Thatcher Steam and Hot Water Heaters.—Fig. 1.—General View of Water Boiler.

of the lower crown sheet, the fire plays directly on the upper crown sheet through these spaces, and also allows the products of combustion to rise and travel through the small flues shown. The fire travel is from the combustion chamber along these two crown sheets to the back of the heater, where exit is found into a horizontal retnrn flue, the travel being to the front through the lower flnes, four in number, and back again to the smoke exit through the four npper flues. By this construction it will be seen that the burning gases are divided into sheets surrounding separated colnmns of water. These water colnmns are arranged so as to allow the water to travel freely to the center of the heater and rise, affording a free and frictionless circulation for hot water heating and having the effect of maintaining a steady water line when used for steam heating.

It will be noticed that the upper part of the boiler is broader than the lower part, providing the proper proportion of flue surfaces for the amount of fire space. The boilers are said to be subjected to a heavy hydraulic pressure previous to being shipped. Being sectional in form they can be readily taken into any building, and in

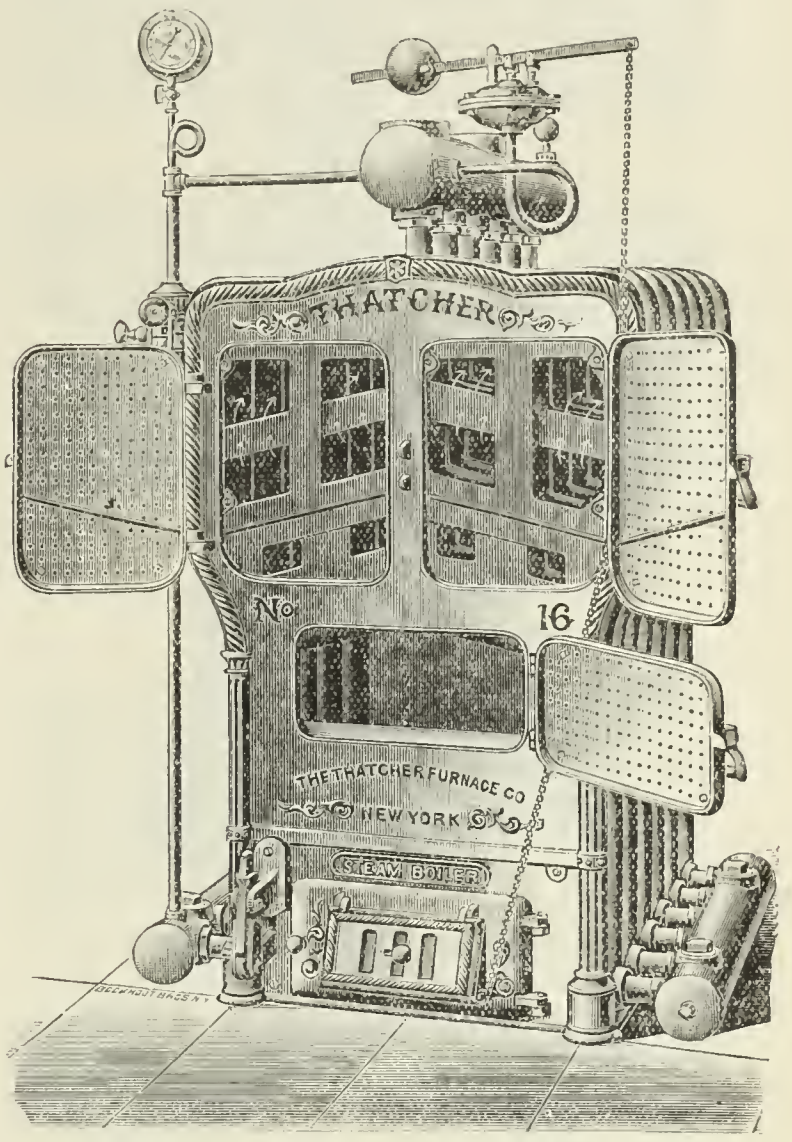


Fig. 2 — View of Steam Boiler.

case of necessity through a narrow door or even a window. They are easily set up and are adapted for the use of a plastic non-conducting covering. They are made in five sizes, standing 67 inches high and provided with a fire chamber 24 inches wide, which increases 6 inches in length with the addition of each section, the smaller sizes being composed of five sections and having a fire chamber 24 x 24 inches in size. They are rated to carry, respectively, 525, 690, 870, 1045 and 1220 square feet of direct steam radiation, and 940, 1250, 1540, 1850 and 2150 square feet of hot water radiation. These ratings are given as the capacities of the boilers in addition to the main and return pipes. Circnlars giving full description, dimensions and prices can be secnred on application to the company.

Examining Plumbers.

It was certainly a novelty, says a Peoria, Ill., paper, to see Chris Klingel, Dan O'Connor, Frank McLanghlin, Charles O'Neill and all the other master plumbers down on their knees with a furnace in front of them and wiping the joints on a couple of pieces of lead pipe, just as they used to do years ago when they were jonrneymen. The sweat rolled from them in small streams, but they stuck to their work until it was finished and then they were photographed by Jesse Sawyer, and it is safe to say that they will preserve the photographs as long as they live. The occasion was the first examination conducted by the Plumbing Board under the recently enacted law. All the master plumbers were there. First they were compelled to answer a number of questions in what is termed elementary work, after which they went through the operation of "wiping the joints," or the practical part of it Some of them did not take kindly to it, but all were compelled to submit, as the new law requires them to be licensed, and before they can be licensed they must pass

an examination. The Board of Examiners is composed of Dr. J. W. Hensley, the health officer ; Thomas McQuellon, the plumbing expert and Fred Studer.

Some of the scenes witnessed were decidedly comical. Few of the masters were willing to admit that they were taking the examination, but insisted that they were simply judges called in to pass upon the work of the others. Some of them had lost the dexterity of their younger years and persisted in getting more metal on the floor than on the joint, but with one or two exceptions all took it good naturedly and offered kind counsel to others of their number. During the afternoon quite a number passed into the council chamber to take a look at the scene and smile at the hard workers. One said the scene reminded him of a polytechnic school. All were glad when the examination was over.

Richmond Boilers.

In keeping with their aim to maintain their prominent position in the front rank of house heating boiler manufacturers, the Richmond Stove Company of Norwich, Conn., call the attention of the trade to some of their recent productions, and the illustrations herewith, and in-

Richmond Boilers.—Fig. 1.—*Broken View of Vertical Sectional Boiler.*

vite the most exhaustive analysis and consideration of the principles of construction which have been adopted by them. They refer to their long experience in and devotion to the manufacture of house heating boilers, and the practice of always giving the closest attention to the re-

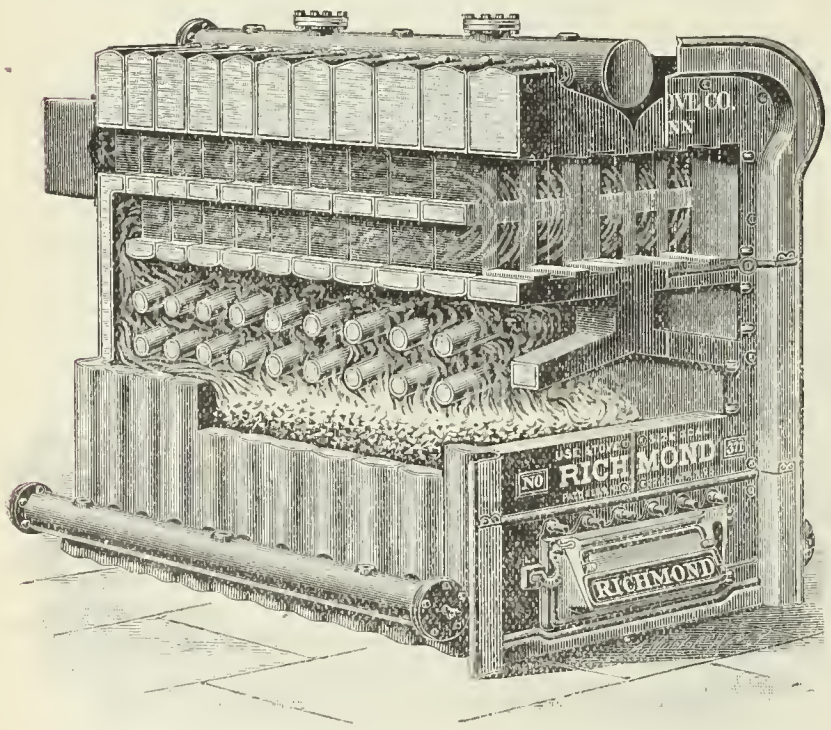

Fig 2 —*Large Boiler with Sunk Header.*

sults obtained, as enabling them to reach positive conclusions regarding the proper area of grate surfaces and fire surfaces and their relations to each other to secure the best and most economical results.

Fig. 1 shows a cross sectional view of a medium size sectional boiler for hot water, and Fig. 2 shows the construction adopted for large capacity boilers. In designing this series of sectional boilers, which embraces capacities ranging from 275 to 5000 square feet for both steam and hot water, it was sought to obtain the largest practicable fire surface within the combustion chamber, and yet in such relation to it, and of such area as to permit of the perfect combining of the gases of combustion, and as supplementary to the combustion chamber, large enough flues to carry the products in combined form to their exit in the chimney—thus getting the full benefit through the entire heater. To sum up, the distinctive features of this line of boilers, as can be seen in the cuts, are : Large com-

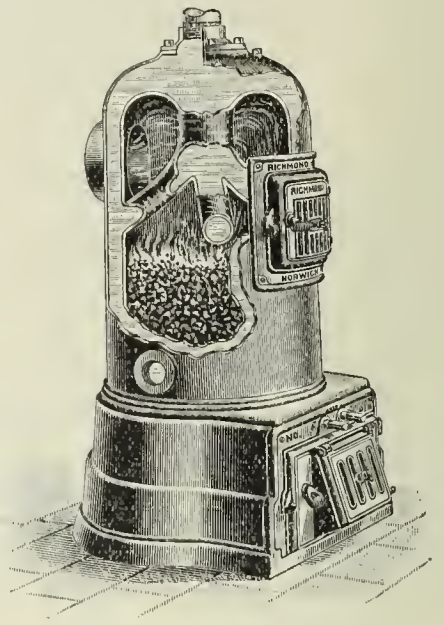

Fig. 3 —*A Hot Water Heater for Small Houses.*

bustion chamber, large direct fire surface, large flues, vertical circulation, no joints between sections, large ash pit and ease of cleaning. If this style of boiler meets with an accident, and one or more sections are broken, those sections may be cut off from the service and the balance of boiler continued in use until new sections arrive. It is a simple matter to insert new sections and increase size of heater, if more work is required than proposed when heater is installed. The absence of gasket and other joints and the relief from mason or brick work are valuable provisions which the contractor will appreciate.

The company explain that by keeping in closest touch with their representatives and customers from the Atlantic to the Pacific, they have become familiar with the varying conditions of different localities, and have produced other styles of boilers to meet special requirements. Special attention is called to the new line of small house heaters, known as the 0 and 900 Series, the 0 Series being for hot water, illustrated herewith. The 900 Series is enlarged at the upper section to form a steam chamber. The fire pot and dome of this boiler is cast in one piece. It has no joints of any kind, and is described as practically self-cleaning. The combustion chamber is large, and the manufacturers have introduced a large amount of direct fire surface to make the boilers quick acting in making steam.

The L. & G. Plumbing Specialties.

The success of the Lalance & Grosjean Mfg. Company, 19 Cliff street, New York City, in manufacturing enameled ware for household purposes is well known. The com-

The L. & G. Plumbing Specialties.—Fig. 1.—*Enameled Sink.*

pany are now putting on the market a line of stamped steel specialties for plumbers' use, which are furnished painted, galvanized, blue enameled and in two styles of mottled enamel. It is pointed out that these goods being stamped up from steel are not liable to breakage as is cast iron, and being less rigid the enamel adheres well.

In Fig. 1 we show a kitchen sink with a wide turned edge. These sinks are made in seven sizes from 16 x 24 to 20 x 40 inches and 6 inches deep. As the enamel finish en-

ables them to be easily cleaned and prevents the adherence of foul matter, it is pointed out that the sink has a peculiar sanitary value. In Fig. 2 we show a steel back which can be furnished in the same different styles of finish and adapted for the various sizes of sinks made, and provided with openings through which the faucets may be con-

Fig. 2.—Enameled Sink Back.

nected. Holes are also provided for fastening, and owing to its being made of steel, it is claimed that it can be secured more tightly against the wall. The lower edge of the back is provided with an extension so as to prevent a leakage at the joint between the sink and the back. Fig. 3 shows an adjustable bracket adapted for the various sizes of sinks made by the company. Fig. 4 shows a round lavatory bowl which, being made of wrought steel, is not liable to breakage and being finished with enamel can be kept as clean as and possesses many of the advantages of the best earthenware. The company point out that their trade in these goods throughout the United States is increasing, and owing to the steel being strong and light it reduces the items of breakage in transportation and freight charges. It is also pointed out that the prices at which these goods

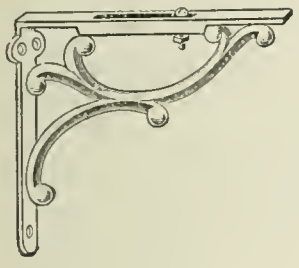

Fig. 3.—Adjustable Sink Bracket.

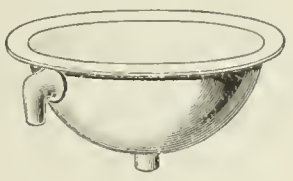

Fig. 4.—Enameled Lavatory Bowl.

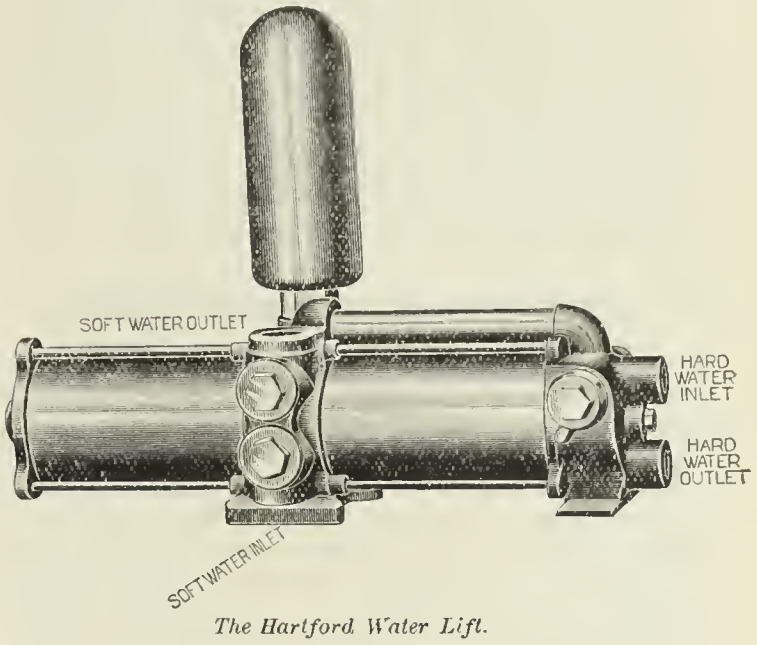
can be sold is another of their attractions. The company issue a 16-page pamphlet giving full particulars in reference to these goods, which can be secured on application.

The Hartford Water Lift.

The automatic water lift or motor pump shown herewith, which is being put upon the market by the L. E. Rhodes Company of Hartford, Conn., has many novel features, and examples the high development which has been reached in small machinery of its class. It consists of two cylinders with two sets of valves and a common piston rod, one cylinder receiving the city water, by the pressure of which the power is obtained to operate the opposite cylinder acting as a double pump. By making the pump cylinder smaller than the power one a high pressure is obtained and city water may be forced and distributed through the pipes at a higher level than it would naturally flow, or cistern water may be raised by the city pressure, or in some instances (as in feeding mixed hard and cistern water to boilers) a combination of different liquids may be distributed. There are well-known devices in use for these purposes, and the novelty of this particular lift lies in various points of design whereby, the manufacturers claim, material advantages are obtained. The chamber for the pump valves acts as a partition between the two cylinders, with the piston passing through a deep stuffing box—the only one in the machine. By this method the working parts of the device are brought compactly together, and it is made possible to remove or change the pump cylinders without interfering with the piping or main body of the machine in the least. In addition to this each lift is ingeniously arranged to take three different sizes of pump cylinders, and consequently at a trifling outlay for an extra cylinder one size of lift can be varied to suit widely different conditions and purposes. This feature is appreciated not only in localities where the shifting water pressure in the city mains demands machines with a great variation in the relative size of pump and power cylinders, but more especially by plumbers and dealers handling these machines, who now need only carry perhaps a single lift to cover all the variations in size. The cut off valve is arranged to seat like a faucet at each stroke, so that absolute tightness is obtained, and at the same time the objectionable wear is avoided which results where the packings pass back and forth over a series of small holes. No oil is needed, and the valve being balanced cannot wear unevenly or stick. A feature that at first sight may seem trivial, and which is yet very valuable, is the placing of the working parts all in one line. This avoids any tendency to push the piston rod to one side, causing it to become worn or the stuffing box to leak, and in fact adds immensely to the efficiency and durability of the lift. All delicate springs, eccentrics, &c., are



The Hartford Water Lift.

avoided, and there are no working parts on the outside, although they are easily accessible. With large ways making it self-cleaning, entirely automatic and self-regulating, not requiring oil or frequent attention, the maintenance of this machine in any household is a simple matter. The same attention is given to accurate workmanship and durable material as in the Spencer organ motors and the Hartford air compressor, other specialties of these manufacturers.

Climax Automatic Air Valves.

In the accompanying illustrations we show a new automatic air valve called the Climax, which is being manufactured by the Judson A. Goodrich Company, 228

Climax Automatic Air Valves.—Fig. 1.—A Transparent View, Showing Construction.

Fig. 2.—Valve for Use Without Drip Pipe.

Water street, New York City. In Fig. 1 a transparent view is given showing the construction of the different styles of Climax valves. The action of the valve is due to what is claimed to be an indestructible composition expansion piece, arranged so that by unscrewing the small cap at the top of the valve it may be adjusted with a

screw driver or withdrawn and renewed in case of necessity. A guide plate for the expansion piece, which is rigidly held at the top, also serves as a diaphragm to prevent water being driven out of the valve. In operation, the condensed water falls on the inner wall to the bottom of the valve, where it is carried off by means of the drip pipes arranged by the heating contractor.

The valve is also made provided with a union for connecting the drip pipe instead of making a direct connection as shown. In this form there is no escape of steam, water or odor into the room, and the valve is well qualified to meet the modern requirements for sanitation. In Fig. 2 the valve is shown designed to be used without any drip pipe connection, the large surface presented by the valve being intended to serve as a condenser for any steam that may escape into it, and to provide a body of water, kept warm by the radiator, which may evaporate and provide moisture for the room in which it is used. The valves are made for ⅛ x ⅛, ⅛ x ¼ and ¼ x ¼ inch connections. Circulars giving full description, dimensions and prices can be secured on application to the company.

DISSATISFACTION AMONG WESTERN PLUMBERS.

It is reported that the master plumbers of some of the Western States are considering the propriety of forming a separate and independent organization on the lines of the National Association, with the special purpose in view of conserving the interests of the West. Dissatisfaction has arisen over some questions in which it is claimed the Eastern members have exercised undue influence in the national body. The largest membership in the National Association being in the East, the charge is made that the interests of the West are not so well cared for as they would be with a purely Western association composed of a membership residing in Western States. Those who are familiar with the methods of the National Association believe these charges to be unfounded, and are of the opinion that the interests of all sections can best be served through one organization composed of delegates from all the States. No better way to promote jealousy between the East and the West could be devised than through the formation of a rival organization claiming to be of a somewhat national character. It would certainly be difficult to secure perfect harmony on all questions, and much of the influence of the great organization built up by hard labor extending over a long series of years would be dissipated. The better plan seems to be the adoption of the methods now followed in some other sections, of forming interstate organizations to work under the National Association and not in opposition to it. Local questions of great importance can thus be handled in direct line with the policy laid down by the main body, but which may need closer attention than can be given by its officers.

A Proposed Sewer Pipe Combination.

A press dispatch from Steubenville, Ohio, states that preliminary steps have been taken by the sewer pipe manufacturers of Eastern Ohio toward entering a combine of sewer pipe manufacturers of the United States, to be capitalized at $11,000,000, which will control the entire manufacture of sewer pipe and terra cotta ware in the United States. At a secret meeting held at Pittsburgh last week 19 manufacturers are said to have signed the agreement. There are 31 other concerns in the same line in the United States, most of whom are also expected to sign. It is proposed if all the manufacturers sign to appoint appraisers who will appraise each plant in the country. If the appraisement is accepted each manufacturer is to receive 25 per cent. of the value of his plant in cash and the balance in preferred and common stock of the new company. Another meeting is to be held shortly in a Western city, and at that time it will probably be definitely known whether or not all the manufacturers will sign the agreement. If they do not all sign it is said the new company will not be formed.

The Judson A. Goodrich Company, 228 Water street, New York, a company recently formed for the manufacture and sale of steam specialties, have elected the following officers : President, Judson A. Goodrich of New York ; vice-president, Richard D Knight of Providence, R. I., and secretary and treasurer, R. Ward Hillman of Brooklyn, N. Y. The new company will be under the management of Judson A. Goodrich, who is well known and has a large acquaintance in the steam and hot water heating trade.

NOTES.

Justice John A. McGowan of Maywood, Ill., has invented an apparatus for thawing frozen ground, and will shortly place it on the market. The machine is equipped with a number of pipes and coils, and the general idea is to generate hot compressed air from the combustion of petroleum gas. The hot air will be forced through an asbestos hose into the frozen ground. The inventor claims that the machine will be of particular value in gold digging operations in the Klondike. Patents have been applied for in the United States and Canada, and a company will shortly be formed for the manufacture of the machine.

Bennett & Hammer, Pittsfield, Mass., have the contract for installing the steam heating system in the new block being erected by Gimlich & White.

T. J. Leonard, Marlboro, Mass., bid $969 and secured the contract for plumbing the new High School Building.

The authorities of Sea Isle City, N. J., have passed an ordinance whereby plumbers who do not leave the streets in good order after making sewer and water connections will be fined $25.

John Drexel, Jr., Reading, Pa., has been awarded the contract for the plumbing and gas fitting in 18 houses, which are being erected by Jeremiah Benner. He is also doing the same work in the parsonage of the Rev. John Brown, at St. Lawrence.

Broomell, Schmidt & Co., York, Pa., have the contract for the Boilers and Steam Heating Apparatus for the new Hotel Monticello, at Norfolk, Va., using the Webster vacuum system.

B. P. Waggoner of Atchison, Kan., has been granted a franchise by the Atchison Council to lay the pipes in the street and build a plant for a steam heating system.

The Gorman-English Company, Wilkes-Barre, Pa., report that they are very much pleased with the reception which has been given by the trade to their Radiator Rests in all parts of the country. They state that they have received the approval of the leading architects and engineers.

The L. J. Mueller Furnace Company, Milwaukee, Wis., have secured the contract for supplying the city of Wauwatosa with a water and storage system for $17,947.

W. H. Meeker, South Norwalk, Conn., has been awarded the contract for heating and ventilating the new Franklin Schools.

Bids will be received until November 16 by the Supervising Architect, at Washington, D. C., for the heating, ventilating, water supply and filtering system for the United States Appraiser's Warehouse at New York City.

The contract for plumbing the new High School Building at Springfield, Mass., has been awarded to the Phillips Mfg. Company of that city for $11,220.

Frank Kelley, Gardiner, Maine, a well known Stove dealer and plumber, was quite severely burned recently through an accident with a gasoline furnace while doing some plumbing for a customer.

We acknowledge the courtesy of President Thomas P. Cullotin of the National Association of Master Plumbers in sending us a copy of the amendments and resolutions passed by the association relating to the Baltimore resolutions and the interpretations and duties of members of the association, and with it a list of the manufacturers and dealers in plumbing goods who are in accord with the Baltimore resolutions.

Sealed proposals for supplying heating and ventilating apparatus and an electric lighting plant for School No. 20 will be received until November 8 by the Committee on Buildings of the Board of Education of New York City.

James Flower, Bro. & Co. of Detroit, Mich., agents for the A. A. Griffing Iron Company's line of Steam Specialties, Traps, Separators, Feed Water Heaters, &c., are meeting with very encouraging success in the sale of these goods. They are transmitting orders almost every day to the factory at Jersey City, besides carrying a stock of the goods at Detroit. They will be pleased to give full information and prices to the trade.

The A. A. Griffing Iron Company, Jersey City, N. J., report an order from the warden of the Kingston Penitentiary, Toronto, Canada, for two No. 207 Bundy Gravity Pumps sold by Capt. Thos. Howard of Montreal. This marks the opening of a business with the Canadian Government, which bids fair to assume quite favorable proportions, as they have many plants in which these devices can be used to good advantage.

James M. McDonald, treasurer of the James McDonald & Sons Company, Tinners' and Plumbers' Supplies, manufacturers of Tin Plate, Cincinnati, is accredited with the following observations by a local paper : "During the

past six weeks the volume of our business has increased to such an extent that we are now selling more goods than ever before. Prices are still low, however, and the margin of profit is not what it used to be before hard times came. We see in our increased sales a much improved condition and are confident prosperity is here."

Thomas J Rice has recently opened a store at 538 State street, New Haven, Conn., to conduct a plumbing, steam fitting, tinning and gas fitting business.

C. F. Blaisdell, York Corner, Maine, is doing the plumbing and placing a Glenwood Furnace in the residence of R. B. Morgan.

A. Craig, Fargo, S. D., is remodeling the steam heating plant in the Hotel Columbia at Moorhead.

David Lott, Birdsboro, Pa., is placing a steam heating system in the shoe factory of L. L. Fountaine.

The Building Commissioners and the Board of Health of Bridgeport, Conn., have appointed a committee to meet with a committee of master plumbers with the view of drafting an ordinance for the regulation of plumbing in that city.

J. W. Quinman has opened a plumbing shop in Farrell's Block, Bemis, Mass.

William Whiting will open a plumbing and steam heating establishment in the north end of Booth Block, at Stratford, Conn.

The American Public Health Association has been in session this week in Philadelphia, and the report of the Committee on Sanitation was prepared by J. W. Hughes of Montreal. In the absence of Mr. Hughes the report was read by Crosby Gray. A variety of devices and apparatus interesting to sanitarians was displayed at the convention.

The D. M. Steward Mfg. Company, Chattanooga, Tenn., are placing on the market a number of new lines of Slate Pencils and Gas Burners, and are about to add a building to their plant which will, they say, double their floor space and greatly facilitate the handling of orders which the improved condition of trade has brought them.

Edward C. Chappelle, Ithaca, N. Y., favored *The Metal Worker's* Philadelphia office with a call a few days since. He was visiting that city for the purpose of purchasing Plumbing Supplies for his new store. He would like to receive catalogues from manufacturers of Plumbing and Heating Supplies.

Robert K. Story, 44 Centre street, New York, is on a business trip in Pennsylvania among the steam fitting and plumbing trade in the interest of the Marsh Air Valves and the Detroit Radiator Valves and his line of Steam Specialties.

Secretary Alexander Don of the W. H. Page Boiler Company, Norwich, Conn., is in town assisting Manager Johnson of the New York office, at 61 Gold street, in attending to the trade on Hornet, All Right, and Volunteer Steam and Hot Water Heaters.

President W. C. McMullin of the Richmond Stove Company, Norwich, Conn., spent a day with C. F. Houss, manager of the New York office, at 85 Centre street, this week, with a view to increasing the trade on the Richmond line of heating apparatus.

E. E. Horton, one of the representatives of the Thatcher Furnace Company, 240 Water street, New York, informs us that Goodrich & Eitopenc, Worcester, N. Y., have the contract to heat the Worcester House with a Champion Steam Boiler.

Application has been made to the Illinois Secretary of State for a charter for the Walcott-Webster Mfg. Company of Chicago, with a capital stock of $100,000, fully paid in. Under this charter it is proposed to consolidate the concerns of the Walcott-Hurlbut Company and Smith & Webster, both of Chicago.

A novel condition exists between a Pennsylvania plumber and his wife. His wife contracted with him to do the plumbing work in a house which she was building, and having done extra work and repairing without orders from her she refused to pay the bills until the matter was disposed of in court, where a portion of the claims made were granted.

A. H. G. Hardwicke, who has conducted the Hardware business of Hardwicke & Co., Niagara Falls, N. Y., for several years past, has decided to sell out, and will be succeeded on November 1 by Walker & Paterson. Mr. Hardwicke announces that he will go into the general contracting business. Mr. Walker of the succeeding firm is a son of ex-Senator Walker of Batavia, and Mr. Paterson was formerly president of the Paterson Hardware Company of Austin, Pa. The new firm are desirous of hearing from manufacturers with catalogues, quotations, &c. Besides handling a general line of Hardware they are interested in plumbing, steam heating, roofing and sheet iron work.

El Paso Plumbers' Association.

The master plumbers of El Paso, Texas, have lately formed a local association of master plumbers in that city, with the following membership :

F. Wild & Co.
McLean & Keayes.
Louis Gasser.

The officers elected are :

President, Richard Keayes.
Secretary, Fred. Wild.
Treasurer, T. E. Hunt.

American Machine Tools in England.

The following from the intensely English London *Engineer*, on American machine tools, will be read with interest : The use of the machine tool in America is entirely unrestricted. The development of it has therefore made great strides. The importation of American tools into this country need not, however, be regarded with the slightest uneasiness. We have not the least hesitation in saying that many English firms can and will produce tools as good as those now being imported. The American tool is not entirely adapted to English work, and in certain respects is distasteful to the British workmen. It would not be easy to say why in all cases. The matter is one of taste, just as a Scotchman blows his bagpipes with his mouth while an Irishman blows his with his elbow. Equally attractive music is to be got out of both, but heredity prejudices each nation in favor of a particular type In other cases it is perfectly easy to account for the Englishman's dislike. One or two of these reasons we may point out. A noticeable feature of American tools is the shortness of crank handles or their replacement by little wheels. We do not question that the American arrangement is designed to give the same power approximately as the English device. To the English mind, however, it does not give the same sense of power and security. Moreover, the control is unquestionably less complete and the labor is rather increased if anything. Not long ago we saw a large American lathe by a well-known firm at work. It was in many respects an excellent tool. The foreman in charge of it said he believed it was a good machine, but nevertheless he did not like it and never felt quite at home with it. One of his chief objections was that whereas he was accustomed to a long rack handle always well within reach of hand or toe, and having a good, steady working leverage, the tool under discussion had quite a short counterbalanced handle and not only needed many rotations to run the slide rest back, but, as we have said, left the operator without the sense of the power of controlling his machine. There are other points, too, which a cursory examination reveals. The most potent is the use of a simple instead of a compound rest on lathes fitted with taper gear. Practically all English lathes have two hand screws on the rest, giving motions normally at right angles, one parallel with and the other perpendicular to the lathe centers. The American, however, uses the latter only. Now in English shops the former gear is used universally for adjusting the cut when facing, and the absence of it is consequently embarrassing. The American does the same thing by clamping down the lead nut and turning the leading screw by hand. We do not doubt that very good work can be done in this way—our cousins are excellent mechanics—but it does not strike one as being so convenient as the method to which we are accustomed and from which we shall not depart readily. Other points in which American and English practices differ will occur to users and makers of machine tools. We think most of our readers will agree with us that the Englishman prefers an English made tool.

We are none the less perfectly ready to admit that American tools are in many respects ingeniously devised and excellently constructed. Makers in this country have much to learn from them ; that they will learn much and turn their knowledge to good account we do not doubt for a moment. In making his designs the Englishman will find that the American practice is unsuitable in several respects. It must not be forgotten that American cast iron is a far softer material than ours. Higher speeds and greater feeds can, in consequence, be used than are ever employed here. The very same fact renders alteration in the design of the main castings of a machine necessary. Besides these vital points there are less important details which need observance if outrage is not to be done to the conservatism of English engineers and mechanics. On the whole, therefore, a slavish copy of American tools is as little likely to make much progress in this country as the original tools themselves. We want automatic machine tools, but we want them stamped with our own and not American characteristics.

TIN PLATES.

Slack Demand for Terne Plates.

The disappointingly slow demand for roofing ternes this year is a matter of sharp complaint among manufacturers of and jobbers and dealers in these plates. Some good judges in the trade estimate the falling off in the consumption of roofing tin during the past season at from 40 to 50 per cent. as compared with the average of the past few years. Various reasons are given for the same, none of which are flattering to the hope of any early expansion in the demand for these plates for roofing purposes. It is generally claimed that other materials, such as wood and metal shingles, galvanized iron, copper and slate, have been used this year on the roofs of many buildings in which tin would usually have been employed. Zinc, too, is said to be coming out as a material for roofing purposes, and in New England some kind of cement compound is reported to be gaining favor as a roof covering. Just why this neglect of tin roofing should be in evidence at the present time is not explained. No specific complaints are brought against it. The old tin roofs, made from imported terne plate, are found to have served their purpose excellently well, and it is certain that the high grade terne plates now being made in this country are the peer in every respect of any that were ever made on the other side of the water.

SCRAP.

In a neat double card, Mortimer H. Cort, successor to N. L. Cort & Co., 9 Burling slip, New York, calls attention to his special brands of Roofing Tin. These are Cort's New Method Redipped, Cort's Old Style, Cort's IC Roofing, Atlantic, Empire State and Reno. All these Plates are made for Mr. Cort in American mills, only the very best quality of material being used in their manufacture.

The Wheeling Corrugating Company, Wheeling, W. Va., who for nearly three years past have been operating a Tin Plate dipping works of five stacks, are reported to be figuring on the erection of a complete Tin Plate plant in connection with their Corrugated Iron manufacturing business.

It is reported that the Humbert Tin Plate Company of South Connellsville, Pa., have leased and will operate the two mill Tin Plate plant of the Stickney Iron Company, at Canton, Baltimore, Md. The plant was erected over two years ago, but has never been run, except experimentally.

The United States Iron & Tin Plate Mfg. Company, Demmler, Pa., will considerably enlarge and completely remodel their present plant. It is proposed to add four new tin mills, making it an eight-mill plant, at the same time maintaining their present sheet mills for the production of the United States polished sheet steel, in the manufacture of which the company have achieved a decided success and for which there is always a very large demand. The cold roll and annealing as well as the tin plate department will be remodeled and enlarged correspondingly.

M. M. Garland, president of the Amalgamated Association of Iron and Steel Workers, has issued a valuable table, giving for a long series of years, month for month, the selling price of bar iron, the puddling rate, the bar mill heating and rolling rate, the selling price of No. 24 sheet iron, the rolling price for sheet iron, and since 1890 the price of tin plate and the rolling rate.

The original intention of the recently incorporated West Leechburg Steel & Tin Plate Company, West Leechburg, Pa., to build a Tin Plate plant, has been changed. The company have decided to manufacture only fine Cold Rolled Steel Strips for the present. The officers of the company are Alfred Hicks, president ; J. W. Kirkpatrick, vice-president ; J. L. Kirkpatrick, treasurer ; Jas. Lippincott, secretary, and F. R. Kenyon, general manager. The Messrs. Kirkpatrick are members of the firm of Kirkpatrick & Co., manufacturers of Sheet Iron and Steel, whose mills are located at the same place.

Not the United States alone, but Italy also, is drawing off the idle Tin Plate workmen of South Wales. A large number of Kidwelly tin platers are reported to have recently left for Italy to work at La Magona d'Italia Tin Plate Works, at Piombino, in Tuscany.

"*Griffith's* List of Tin Plate Manufacturers and Brands," dated October 16, 1897, gives 16 Tin Plate works in South Wales and Monmouthshire, with an aggregate of 116 mills, as entirely idle or for sale. These include such well-known concerns as the Ashburnham Works, Burry Port ; Burry Tin Plate Works, Llanelly ; Cwmfelin Works, Swansea ; Pontypool Works, Pontypool ; Port Talbot Works, Port Talbot ; Gwendraeth Works, Kidwelly ; Worcester Works of Wm. S. Williams & Co., Morriston, and all four of the plants of Philip S Phillips & Co.—namely, the Abertillery, Lion, Pontymister and Machen Works, having an aggregate of 35 mills.

The Leechburg Foundry & Machine Company, Pittsburgh, Pa., have booked an order for a No. 2 Mesta Pickling Machine, arranged to pickle long sheets, for the Hyde Park Iron & Steel Company, Hyde Park, Pa. They are also supplying a No. 2 Mesta Pickler for the new plant of the West Leechburg Steel & Tin Plate Company, West Leechburg, Pa.

The new Tin Plate plant of Hamilton & Co., at West Newton, Pa., is progressing toward completion and will probably be ready for work within a few weeks.

The new Black Plate mill of Zug & Co., Limited, Pittsburgh, Pa., started up last week.

The new Bar mill of the American Tin Plate Company, Elwood, Ind., will be running within a week or two, giving employment to a number of additional hands.

The contract for the new six-mill Tin Plate plant of the Laughlin Nail Company, at Martin's Ferry, Ohio, has been placed with the Totten & Hogg Iron & Steel Foundry Company, Pittsburgh, Pa. The order includes buildings covering an area of 65,500 square feet of ground, a 1500 horse-power Ætna rolling mill engine, three smaller engines, with boilers, eight hot mills and eight cold mills, three electric traveling cranes, shafting, pulleys, &c., roll lathes, 17 pair of shears, one heater, and pickling, tinning and branning machines to equip the tin house.

Such good progress is being made with the new eight-mill Tin Plate works, which the National Tin Plate Company are erecting at Monessen, Pa., that they expect to be able to start up a portion, at least, of the plant before the close of the year. Four mills will be put in operation at first, the other four being added later.

The Canonsburg Iron & Steel Company, Canonsburg, Pa., have decided to add two new hot mills to their Tin Plate plant. They are about to discard one of their Bar mills and alter the present plant in other directions, so as to increase their capacity for the production of Tin Plate and Sheet Iron.

The Neshannock Sheet & Tin Plate Company, who have organized, as reported last week, to take over the Arethusa Sheet Mills, at New Castle, Pa., are reported to have placed a contract with the Leechburg Foundry & Machine Company, Pittsburgh, Pa , for converting four sheet mills into tin mills, furnishing the necessary rolls and providing a Mesta pickling machine, &c. It is probable that the company will not at first operate a tinning department.

A special cable dispatch of October 27 from London, states that the Welsh Tin Plate Workers' Union have decided to accept a 15 per cent. reduction from the 1874 wage list, commencing November 1.

The Frank-Kneeland Machine Company of Pittsburgh, Pa., manufacturers of Rolls, Rolling Mill and Tin Plate machinery, advise us that trade with them is very good, they having entered some large orders this month for heavy machinery. Among these is a contract for two additional Mills and other equipment for the Pennsylvania Tin Plate Company, New Kensington, Pa.; a Universal Mill, Transfer Tables and Shears for the Granite City Steel Company, St. Louis, Mo., and a 26 inch heavy Sheet Mill and Tables and Shears for the Reeves Iron Company, Canal Dover, Ohio. In addition to the above contracts, the firm have received other orders for Shears, Sand and Chill Rolls and General Castings, and regard the outlook for the future as extremely encouraging.

THE RETAIL STORE.

An Incandescent Petroleum Lamp.

The long promised incandescent petroleum burner of the Incandescent Gas Light Company, Limited, says the London *Gas World*, is now a substantial entity. Evidently the company have exercised extraordinary caution in developing their petroleum burner, and the result they have now achieved amply justifies the time occupied in

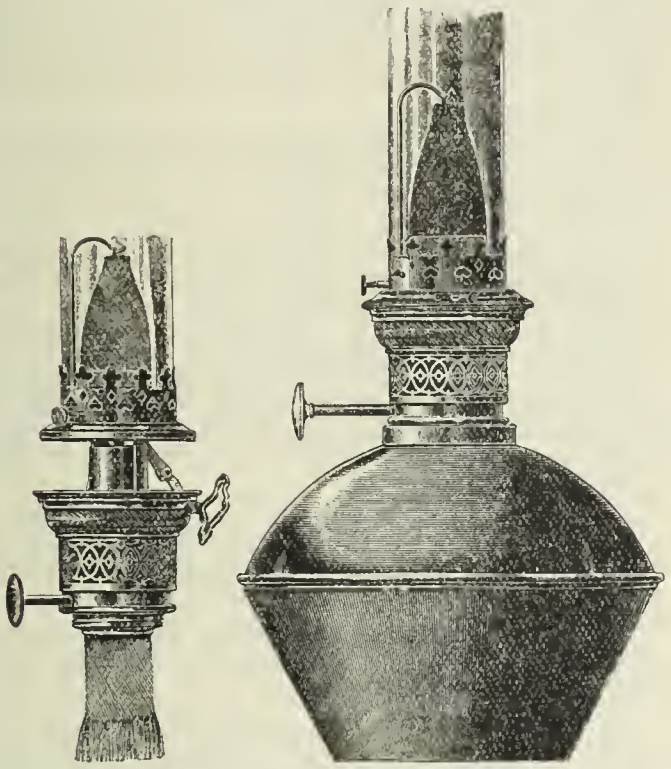


Fig. 1. *Fig* 2.

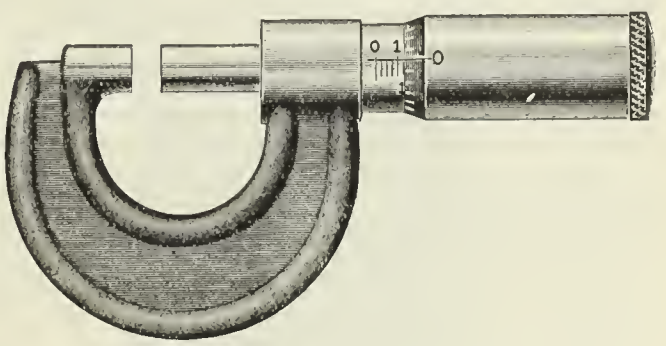
An Incandescent Petroleum Lamp.

attaining it. The new lamp is simplicity itself, and but for the mantle and a rather tall chimney it might pass anywhere as an ordinary oil lamp. Indeed it can be converted into such with the greatest ease. The blue flame necessary to the Welsbach mantle is obtained in this burner by currents of air drawn up on both sides of the circular wick, and the adjustment of the wick to obtain the blue flame can be made easily and accurately, it being only necessary to turn up the wick till the flame is on the verge of making a noise like that of a miniature fog horn. Experiment shows clearly that the maximum incandescence of the mantle is obtained when the flame is just below the sounding point, consequently the lamp may be said to be its own protector against bad usage, for no one, however careless, would tolerate the noise it makes when the wick is turned up too far. When the lamp is to be lighted the wick is exposed by lifting the gallery carrying the chimney and mantle by means of a patent lifter, Fig. 1. The wick having been lighted the gallery is lowered and the wick turned up till just below the sounding point, when everything is in proper working order, Fig 2. The light given by the mantle seems softer to the eye than that given by the Welsbach gas mantle, which may be due to the wider mesh and coarser texture of the fabric. The oil found best adapted to the lamp is American oil of about 760 specific gravity, but we are informed that oil of any specific gravity, up to Scotch shale oil, can be used, the only difference being that with the heavier oils the wick and burner require cleaning more frequently. With the 760 oil it is only necessary to trim the charred edge of the wick once in every six or seven days, while with heavier oils it may require attention every day. But to those accustomed to the use of oil lamps this trimming will present no difficulty. What may be called the incandescent portion of the burner is attached to the burner proper by a bayonet joint, and when this has been removed the user has to deal with what is practically an ordinary oil lamp. Consequently, trimming, cleaning and filling introduce no new feature to the habitual user of oil lamps. We are informed that the lamp gives an average of 45 candles with one-third the oil consumption of an ordinary lamp of similar power. The burner, which has been named the Era, can be fixed to any duplex lamp supplied with screw or bayonet fittings, and in the event of a mantle not being available at the moment it can be converted into an ordinary luminous flame burner by the addition of a special cap supplied for the purpose. The lamp can be swung about in a manner that would be almost certainly fatal to an ordinary oil lamp, and the way in which those best acquainted with its ways blow directly down the chimney sets the recommendations of the London County Council at defiance. By the introduction of this burner the Incandescent Gas Light Company seem to have made almost as big an advance in oil lighting as was made ten years ago in gas lighting by the introduction of the incandescent gas burner. It promises to find general acceptance where gas is not available, and for the gas manager who may fear its competition we have a word of comfort. The price of the burner is such that it will not appeal very strongly to the class that the gas companies are now so successfully wooing from the oil lamp to the slot meter. It should be mentioned that the Era burner is only licensed for use with Welsbach mantles and that only Welsbach mantles are allowed to be used with Era burners.

One-half Inch Micrometer Caliper.

J. T. Slocomb & Co., 235 Eddy street, Providence, R. I., have put on the market a ½-inch micrometer caliper, as shown herewith, the internal arrangements of which are the same as their 1-inch size caliper. The tool illustrated is light, weighing 1¾ ounces, and is designed as a pocket sheet metal and wire gauge, and for measuring anything within its range. It is intended to take the place of the ordinary wire gauge for obtaining the size of wire and the thickness of sheet metal in decimal



One-half Inch Micrometer Caliper.

parts of an inch, instead of by numbers or letters. The point is made that it will remain accurate, as there is an adjustment providing for wear.

Miller, Sloss & Scott.

Miller, Sloss & Scott, San Francisco, Cal., have just issued a general catalogue of 1236 pages, handsomely printed, bound in cloth and leather. The book is known as Catalogue No. 7, and was published on the sixth birthday of the firm. The press work was done by a San Francisco firm. The catalogue is divided into seven departments, as follows :

	Pages.
1. Tools and Farming Implements	2 to 276
2. Locks, Latches and Builders' Hardware	278 to 674
3. Miscellaneous Hardware	676 to 852
4. Pocket and Table Cutlery, Razors, Shears, Plated Ware, &c	854 to 1022
5. Guns, Pistols, Ammunition, Fishing Tackle, &c	1024 to 1148
6. Brass and Iron Valves and Fittings, Steam, Gas and Water Supplies	1150 to 1202
7. Iron, Steel, Rails, Metals, Cast and Wrought Pipe, Tubes, &c	1204 to 1236

The parts of the catalogue pertaining to each of these departments are also published separately in bound form and distributed among parties who are interested only in particular departments. The aim throughout the work has been to illustrate and describe in a plain, compact form the various lines of goods carried in stock, using

manufacturers' lists and numbers as far as practicable. On goods not having a manufacturer's number or list the firm's own numbers are used to facilitate ordering and to avoid errors. Lists are made in this connection to show comparative values. No discount sheet is issued, owing to constant changes in prices, but inquiries will always receive immediate attention. Mail orders are made a specialty of, and are filled at lowest market prices. A full page illustration shows the firm's establishment, 18-22 Fremont street, and another page is devoted to a picture of their warehouse. The department index is followed by a general index of 34 pages, this being cross indexed to assist in readily finding any article desired. The book is well printed on a good quality of paper, with excellent illustrations. The matter on each page is well arranged, leaving sufficient blank space for merchants to enter discounts or to note changes in list prices. This is an especially complete, comprehensive and well arranged catalogue which reflects much credit on the enterprising house issuing it.

Brownfield's Buyers' System.

The Folding Paper Box Company, South Bend, Ind., are doing an increasing business in Brownfield's Buyers' System, a system for preserving for immediate reference catalogues, quotations, price-lists, discount sheets, special memoranda, samples, clippings from trade journals and buyers' printed or written information of every description. A cabinet with subject and catalogue boxes, index, catalogue cards, gummed labels and quotation memoranda blanks are included in the system. Complete directions to be followed in the successful use of the system accompany each outfit. Cabinets of different sizes are furnished suited to the requirements of any particular business. Testimonials show that the system is giving satisfaction to manufacturers, Hardware firms and others.

MEMORANDA.

The A. C. Barler Mfg. Company, 104 and 106 Lake street, Chicago, are best known to the trade as manufacturers of the Ideal Oil Heater. They are, however, very enterprising and do not confine their attention to one product. We have just received from them a very artistically embellished "post card" calling attention to their Safety Document File, which is ingeniously designed to meet a busy man's needs. It consists of a japanned steel case or box, made in two parts hinged together. In the upper part or lid is a receptacle for arranging documents so as to be conveniently accessible, this receptacle containing from 24 to 50 pockets, according to the size of the case. When closed, it is safely locked, two steel keys being furnished with each case. It takes up very little space, the smallest size being 3 x 5¼ x 11 inches, and the largest 7½ x 5¼ x 11 inches. The company are doing a good business. Last week they shipped 40 Ideal Oil Heaters to Smyrna, the letter containing the order having required 18 days to reach them. They recently sent 50 Heaters and 510 Document Files to London and also shipped ten Stoves each to Kobe and Yokohama, Japan, while a retail merchant in France, who bought one last year, has ordered another.

Fred. Tettenborn of Tettenborn & Co., Cincinnati, Ohio, in speaking of the condition of trade, states that they are doing more business now than at any time within the past three years. He says he looks for a year of continued prosperity because money is finding its way into the hands of the masses and there is a general awakening of the people.

At a meeting of the Stove dealers of Washington, D. C., held on the evening of October 20, at 1220 H street, N. W., an organization was formed, known as the Stove Dealers' Protective Association, with R. M. Harrover as president and Mr. Febrey of the firm of B. F. Guy & Co. as secretary. Another meeting will be held on Monday, November 1.

The Eckles Company of Decatur, Ill., are said to be building one of the largest portable bake ovens in the city. It is made of Russia iron lined with asbestos and is 30 inches deep and 60 inches high. It will hold over 75 loaves of bread, and is being put up for the Wilbur Bakery.

George Sykes, who has been for a number of years in the employ of A. M. Parmenter, has opened a tin shop at the corner of Main and Broad streets, Knoxville, Ill. Mr. Sykes has had over 30 years' experience at his trade, and has done some large work in the locality where he has established himself.

H. A. Hatch & Co. have opened their new store in the Miuton Block, Forest Hills, Mass., where they carry a fine line of Stoves, Ranges, Furnaces, Steam and Hot Water Heaters, &c. Tin aud sheet iron work in all its branches is given attention, and the firm will also attend to plumbing and sheet metal work. Messrs. Hatch & Co. are agents for the Boynton Steam and Hot Water Heaters.

The retail men in Brockton, Mass., who make it a part of their business to store Stoves during the warm months have been working overtime recently in delivering Coal Stoves to their customers. It is about this season of the year that many of the dealers declare that they will never store Stoves again on account of the trouble and annoyance incident thereto.

Paxton Hardware Mfg. Company, Paxton, Ill., are running their factory 12 hours a day to keep up with orders for their Roasters and Bakers. They state that they are now sole manufacturers of the Oriental Tea and Coffee Pot under contract with the Oriental Tea & Coffee Pot Company. There is said to be a large demand for this Tea and Coffee Pot throughout the West and orders are referred to as coming in freely.

The Wagner Mfg. Company, Sidney, Ohio, manufacturers of Iron and Aluminum Hollow Ware, have purchased for $40,000 the plant of the Sidney Hollow Ware Company, at that place. The two works will be run under the management of W. H. Wagner, president of the Wagner Mfg. Company.

The Carleton Mfg. Company, Sullivan, Maine, have organized for the manufacture and sale of Tinware, Pails, &c., with a capital stock of $10,000. E. B. Colcord is president of the concern.

A little slip used in the envelopes of Keen & Hagerty, Baltimore, Md., calls attention to their S. & B. "Strongest and Best" Galvanized Corrugated Washtubs on one side and on the other to the improved Maryland Oil Tank, designed for the use of those who retail kerosene or other oils. It is equipped with a pumping device, funnels and a set of measures. The Tank is made of galvanized sheet steel with a body corrugated, and also the bottom, to add to the strength. The bottom is also reinforced by strong wrought iron bands.

P. H. Kiernan informs us of the removal of his tinning and plumbing shop to 10 State street, West, Savannah, Ga., where he is making a specialty of the Royal Manhattan Range and the Cotton Plant Cook.

Olsness & Aslakson have recently opened a store in Sheyenne, N. D. Their stock comprises Hardware, Stoves, Tinware, Sporting Goods, &c.

W. T. Pace, Franklin, Va., has built a new warehouse for the accommodation of his stock of Hardware, Stoves, Tinware, Agricultural Implements, Steam Fittings, &c. He has also enlarged his office facilities, and added Building Materials to his line of goods.

Walter T. Cassells of Cassells & Co., Buenos Ayres, Argentine Republic, is in New York, making purchases of House Furnishing Goods, Stoves, Enameled Ware and kindred goods. This house import most of their supplies from America. Mr. Cassells has been in this country about a month, and will return to South America October 23.

Wilson Brothers, dealers in Hardware, Stoves, Tinware, &c., Roswell, N. M., are erecting a new store and warehouse, 25 x 150 feet. They refer to the present condition of business as better than at any time during the past three years with very encouraging prospects.

J. F. Ochsner, Nauvoo, Ill., dealer in Hardware, Implements, Stoves, &c., is erecting a new building, 50 feet wide by 100 feet in length, three stories high with 14-foot ceilings. The front will be pressed brick and stone. The cost of the building is estimated at $7000 to $9000.

M. Conner & Son, Plymouth, Mich., made an exhibit at a local fair this fall which was nicely arranged, showing a variety of goods and attracting considerable attention. The back and sides of the space were covered, and displayed samples of Mechanics' Tools, Brushes, Tinware, &c. In front was a showcase upon a counter containing a variety of small articles. Upon either side of the case were Heating Stoves. Over head large Oil Cloth patterns were looped, following the upward slant of the roof of the building.

Newell & Hewitt, Hardware, Plumbing, Roofing, &c., Punxsutawney, Pa., have been succeeded by Hewitt & Johnson.

Matthai, Ingram Company, Baltimore, Md., and 79 Beekman street, New York, are putting out a new cold handle stove lifter made of one piece of metal, with round hollow handle ⅞ inch in diameter, strengthened on the lower half by two longitudinal ribs or corrugations. They are made in three finishes, all one size—viz., black, retinned and blue enameled, numbered 5, 10 and 15, at $1.75, $2.60 and $4.25 per gross, respectively.

F. H. Stoltze has opened a retail Hardware, Tinware, Stove and Furniture store at Larimore, N. D.

STOVE TRADE NOTES.

The Lost Chord, or the Speech That Was Never Spoken.

There is an old saying to the effect that silence is golden and speech is silvern, but a startling exception to prove the truth of the time honored adage has been brought to our notice by ex-President Kahn of the National Association of Stove Manufacturers, who has rescued from oblivion the following address which Henry Gleason did not deliver before the gentlemen of the stove convention at Detroit last May:

I received a letter from President Kahn a few days since which said, "Henry, we shall expect you to respond to a toast or make a short speech." He very generously reminded me that my previous efforts had only been humorous. "A little nonsense now and then was relished." The present condition of business was serious and he requested me to dish up something substantial—if I could show a cloud with a silver lining, or a gilt edge, to do it.

His pessimistic letter, brethren, prompted me to write a sermon and I have taken for my text:

"What shall it profit a man if he manufactures all the stoves in the world and loses his only dollar? Or what can a man get in exchange if he desires to sell his foundry?"

You should all be thankful you are alive—to be present to enjoy the annual symposium of the stove men. One who can go through the fiery furnace of business reverses of the past two years need have no fear of the hereafter. Running a stove foundry only three days a week will make a salamander of the best of us. Men do more in this, the nineteenth century, for honor and place than for profit. So, with the man who makes all the stoves in the world without profit, he must do it for honor and glory—the credit, the good fortune, the dignity, the delight, the happiness, the pleasure and the gratification of having made all the stoves in the world—and this will more than compensate him for the loss of his only dollar. At the banquet given by Eve in the Garden of Eden to Adam she had no chance to steel a range or she would have sliced up the apple and served it in a pie, and what would it profit Eve could she have selected a Garland, Peninsular, Acorn or Detroit Best, or found a range with an indicator on the oven door to amuse the cook, or selected from all the world's productions, and still lost her inheritance to the Garden, just the same as you lose your last dollar?

Gentlemen, what you need is a Health Board. I can name a few men who have had the air tight, oak, steel range and other fevers and still lived, yet lost their only dollar. My brethren, "many are called, but few are chosen," so but few make a great success of any specialty. The most serious epidemic is the hot tamale, or sheet iron stove, now being made in every cross road tin shop, and many will not only lose their last dollar, but cents. And you would still be happy and say "Life is worth living" were it not for the annual visit of the stove knob fiend, who offers to give you the knobs and send a man to screw them on, or the artful genius who induces you to buy a stove urn large enough for a church steeple and arms spreading like a lobster, which costs more than the profit on your castings—and you lose your only dollar. I am reminded of the last sentence in Brother Kahn's letter: "Gleason, make it short."

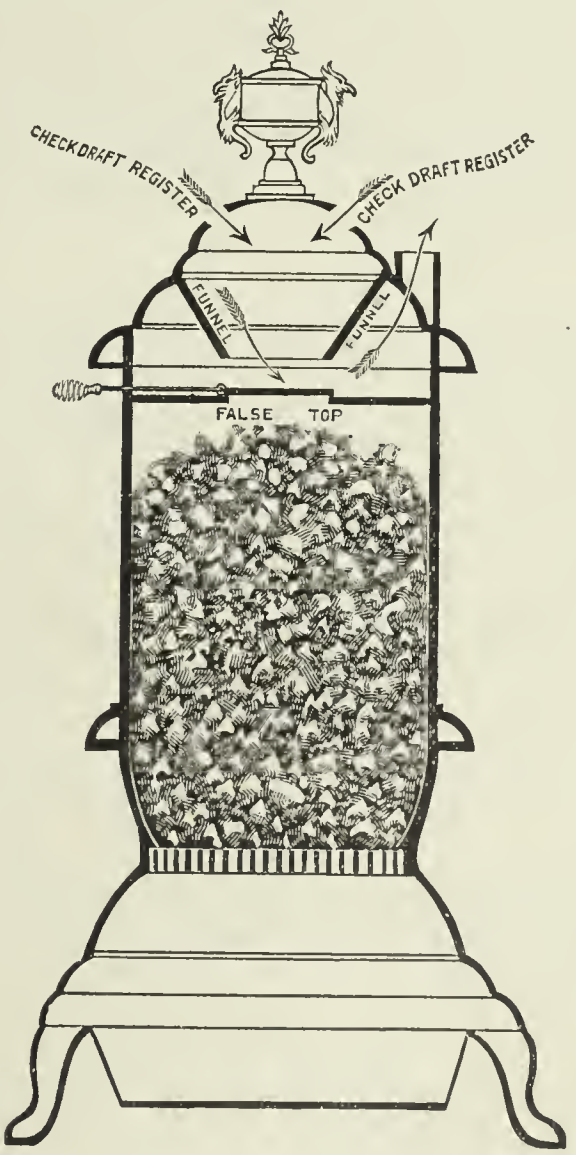
Michigan Stove Company's Export Trade.

Speaking in regard to their foreign trade, George H. Barbour, vice-president of the Michigan Stove Company, Detroit, Mich., says in an interview with the representative of a local paper:

We have had some foreign trade for many years, but have given it more attention lately. We found England a poor market. The English would buy a few American stoves, and then steal the patterns and make a clumsy imitation of our stoves for themselves. They are now using stoves made in England after the American patterns of four or five years ago. The Germans are much better customers, but we have had some difficulty there on account of their tariff regulations. We lost an excellent customer at Frankfort-on-the-Main through these regulations. They have there one duty on plain iron and another on iron that is nickel plated. They were not content at that port to unpack one stove out of a load, and levy the duty on all the rest at the same rate, but insisted that every stove in the consignment, though they were all alike, should be uncrated and inspected. As the stoves were very carefully crated for shipment, it was a good deal of a task to take off the crating and then repack them, and our customer, through whom we were building up a good trade, gave it up on that account. Our last foreign shipment was to Africa, and I was rather astonished at the high grade of goods that was demanded for that market. We have paid considerable attention to the Argentine market, but as they use chiefly gas and oil stoves we are not getting the trade there that we anticipated. But in spite of the drawbacks mentioned we are doing a fair business in foreign countries and expect to increase it.

The Special Retort Oak.

A sectional cut is herewith presented, showing the inner construction of the New Special Retort oak stove, manufactured by the Marion Stove Company, Marion,



Sectional View of the Special Retort Oak Stove.

Ind. It has no doors, fuel being fed at the top. The following description of the stove is furnished by the company:

In order to get the construction of the Special Retort Oak fairly before the reader it will be necessary to first give the motive for its construction. For years we have contended that there was practically no difference in the value of the different fuels—anthracite and bituminous coals, coke and wood—except their price in the market. Heretofore it has been impossible to reach any satisfactory conclusion, because there was no construction capable of properly burning all these different fuels, and it became necessary to invent a special construction for the

purpose. In order that the best results might be obtained, what is known as the slow combustion principle was adopted, and slow combustion could only be obtained by a systematic repression of combustion. In order to attain this end it was absolutely necessary that the shell or body of the stove should be absolutely air and gas tight.

The necessity of draft for the promotion of combustion is apparent to every one, and in order to obtain this a grate was placed in the lower part of the shell, the grate having a dump and shaking center, with the anti-clinker principle applied. By this means a grate was provided that could be cleaned without disturbing any of the fuel in the stove. About 3 inches below the top of the shell is placed a false top, or diaphragm, fitting the shell tightly, and in the center of this diaphragm is an opening for the introduction of fuel. In order that perfect control of the fire might be had, a sliding damper was placed on the upper side for the purpose of regulating the size of the central opening in the diaphragm. This damper is peculiar in that it has the front edge cut away in such a manner that the opening can never be entirely closed. Above this diaphragm, and registering with this central opening, is placed a funnel, for the double purpose of conducting the fuel through the diaphragm into the combustion chamber and also to serve as a regulator for the draft. This funnel is covered by the swing top of the stove, which top contains a register, operated by means of a lever extending through the front edge. This register is for the purpose of checking the draft and assisting in the control of the fire. It will be observed that the stove is made in the usual form of the oak, with cast iron base and fire pot, surmounted by a heavy steel body and the usual oak stove top. It will also be observed that the stove has no doors, experience having shown that a door to a stove is unnecessary and an expense, and that 90 per cent. of all the dirt made in the use of stoves is caused by the opening and closing of the doors in the admission of fuel. In this particular lies the great novelty of this construction, it being absolutely air tight between the grate and diaphragm, which of necessity it must be if the slow combustion principle is to be applied, which is but another name for suppression. Fire has been carried in this stove seven days on 58 pounds slack and a fairly good fire maintained.

Richmond Stove Company.

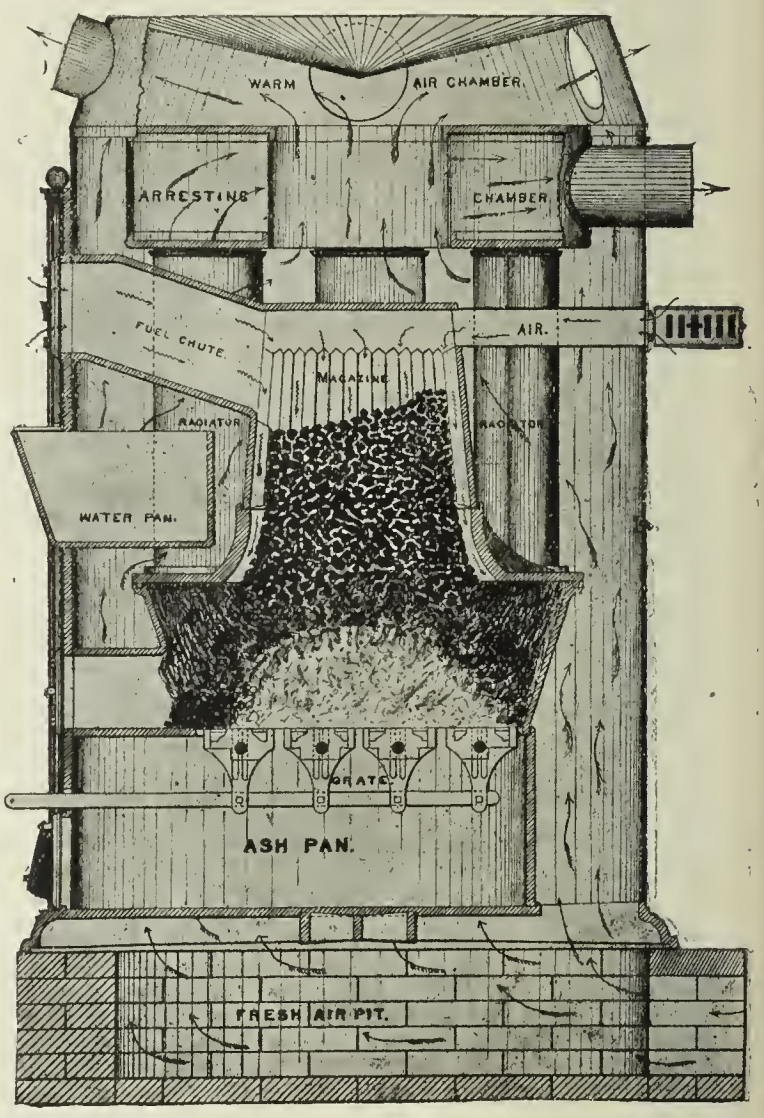
The Richmond goods form the basis of some very attractive literature which is being distributed in the shape of several pamphlets by the Richmond Stove Company of Norwich, Conn. The printing is in two colors on heavy paper, and the covers carry the word "Richmond" in script type. The first of the pamphlets is devoted to Series 1, 2 and 3 of Richmond ranges, in the production of which the manufacturers state they have spared neither time nor expense. In fact, they have put into the construction of this range "the accumulated knowledge of 30 years' experience" and proclaim it "a master piece among range constructions." The range is made in three sizes and 24 styles for hard or soft coal or wood. It has large oven, and it is stated that owing to the system of ventilation employed all objectionable odors are drawn into the flue and carried off. Another important advantage of ventilation which is referred to is in retaining the natural moisture of the air within the oven, thus preventing the drying up and wasting of nutritious juices during the process of baking or roasting. The fire box is of unusual capacity and is lined with Dighton Rock fire brick. The range has a double flue and the parts are so arranged that the products of combustion pass twice around the oven. The range is shown in several varieties, and there are presented illustrations of Cooper's oven thermometer, which is used in connection with the Richmond ranges, and of the grate employed, together with directions for using. One page of the pamphlet is devoted to a price list and another tells the story of the Richmond range. The second pamphlet deals with Series 33-45 of the Richmond range, which is referred to as entirely modern in its equipment and as thoroughly and scientifically built, as the name Richmond warrants. The third pamphlet describes Series 173-194 of the Richmond range, which is shown in several of the varieties in which it is offered.

Fine Molding Work.

Stove foundries would have been greatly interested in an exhibition of castings made by C. A. Truesdale, superintendent of Wm. Resor & Co.'s stove works, at Cincinnati, on the 20th inst. They were shown to the Western Foundrymen's Association, then in session, to illustrate how perfectly their castings could be made with no other facing than the silica sand used in the mold. Finely carved work was shown gated on the face, but with no gate marks visible, or only to be detected on the very closest scrutiny. Perfectly true stove lids were among the specimens, which had been tripod gated. Portrait medallions and other art work were also gated on the face, but no gate marks were to be seen, while the fine lines were wonderfully sharp—in fact, as sharp as if filed after cleaning. The special sand used in molding those castings is known as Dresden silica sand and comes from a deposit 60 miles south of Louisville, Ky.

The Faurot Economic Furnace.

In the accompanying illustration we show a sectional view of the Faurot Economic furnace, manufactured by the Faurot Mfg. Company, 112 West Sixth street, Kansas City, Mo. This furnace is provided with the usual ash pit and labor saving grate and is arranged to receive a supply of air from out of doors. The upper portions of the furnace are of special construction, which, it is claimed, enables it to burn soft coal with the same results as are obtained from the use of hard coal in other furnaces. The feed chute serves a double purpose in supplying the furnace with fuel and air. It is pointed out that the air in entering the furnace meets the gases that are generated by combustion and carries them down through the fire, where they ignite and secure a combustion preventing the generation of black smoke and soot, so that the furnace may be understood to work on the down draft principle.



The Faurot Economic Furnace.

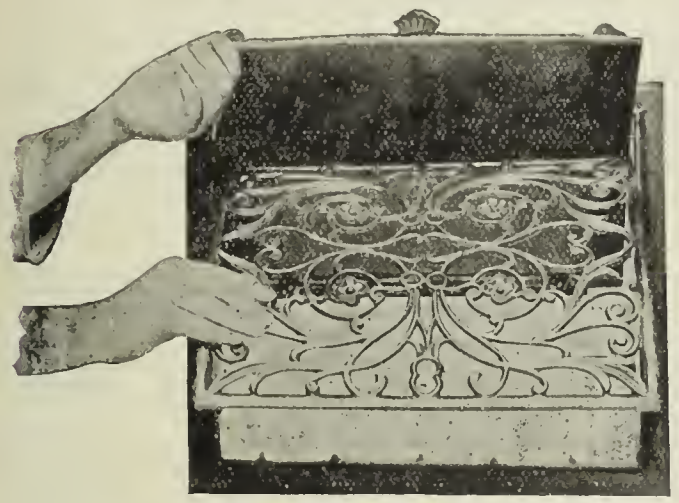
The products of combustion on leaving the fire pass through a series of round radiators to a circular drum, from which they find exit to the chimney. It is pointed out that this down draft and indirect travel insure the heating of a large surface with which the air is brought in contact in passing through the furnace. The ash pit door is made without draft slides and is only used for the removal of ashes. Just above the ash pit door is a clean out door through which any refuse may be removed from the fire that is not readily disposed of by the labor saving grate provided. The furnace is also made as a combination heater with a capacity of heating from 150 to 500 square feet of radiation. The furnaces are made in several sizes adapted for buildings of different sizes.

The item recently published concerning the new steam plant installed in the Round Oak Stove Works of the estate of P. D. Beckwith, at Dowagiac, Mich., needs some slight corrections and additions. The engine is a heavy duty cross compound condensing engine of 500 horsepower capacity, built by the E. P. Allis Company of Milwaukee, Wis. Babcock & Wilcox boilers were put in as stated, and it is believed that the power plant thus equipped has no superior in the country, from the stand-

point of economy of fuel. The works had outgrown the old engine and boilers, so that putting in the new power appliances was absolutely necessary to enable the largely increasing business to be properly handled.

Clear's Convex Cleanable Registers.

Charles Clear, Jr., 721 Pine street, St. Louis, Mo., is putting on the market a register that he claims has special features which should interest the trade. The face is detachable and made convex, so that the register frame does not necessarily extend back into the flue to reduce its size,



Clear's Convex Cleanable Registers.—Fig. 1.—*The Method of Adjusting*

and hence is particularly adapted for use with partition flues. The register proper is made in three parts, the frame, the ornamental grill forming the face plate and the shield or hood. In Fig. 1 the register is shown and the method of adjusting it. In Fig. 2 the register is shown adjusted as in use. In order to change the location of the shield or hood it is necessary to first lift the grill, and when adjusted the grill falls in place and locks the hood in position at whatever angle desired. During the summer season or at times when it is desirable to close the register entirely, by raising the grill and releasing the hood the hood can be drawn through the frame and dropped down in front of the register grill, entirely closing it, the back of the hood being ornamented so as to present a pleasing appearance. These registers are adjusted to fit wall pipes

Fig. 2 —*Adjusted as in Use.*

from 3 to 6 inches deep and from 8 to 14 inches wide. The register can be attached to the hot air flue very easily and with little labor. The registers are made in several sizes and finished in japan, bronze, nickel plate, and are also made in solid bronze and solid aluminum. Another feature of the register is the ease with which the parts of the register may be taken out to enable them to be cleaned.

The new club house of the Indiana Club, at South Bend, Ind., was recently opened for the use of its members. The building is heated by two Kelsey Hot Air Furnaces, with a system of heating designed by Irving A. Sibley, the plumbing being done by H. P. Blair & Co.

ODD PLATES.

Stanhope Boal, vice-president of the Favorite Stove & Range Company, Piqua, Ohio, in speaking of the situation and the outlook for the Stove trade says in an interview with a representative of a Cincinnati paper : "Business has improved with us, and we consider the future at present very much brighter than it has been at any time for two or three years. We have been running our works full all the year and expect to continue doing so. The enormous crops and good prices they are bringing, together with the confidence existing in financial circles, make the situation more favorable than it has been for a long time."

The Scranton Stove Works, Scranton, Pa., were reminded very forcibly of the disaster on the Hudson River Railroad last Sunday by receiving a communication from one of their customers in Saranac Lake, N. Y. The letter, which inclosed a check and bill, was on the train that made the fatal plunge into the river, but was forwarded to the Scranton Stove Works after being dried from its water soaked condition. On the back of the envelope is the notice from the New York Post Office giving the cause of the delay. The envelope was not as clean as when it left the paper maker's hands, and the address of the Scranton Stove Works looked as if it had been through a copying press, otherwise there was nothing to tell of its unusual experience.

The Indianapolis Stove Company of Indianapolis, Ind., are now settled in their new quarters and the large foundry is completed, ready for active operations.

The president of the John Van Range Company of Cincinnati, Ohio, L. E. Ziegle, reports indications for a greatly improved demand for goods of their manufacture the coming season. He is led to this conclusion by reason of the large number of inquiries from all sections of the country for prices and also from interviews with a number of their customers.

The Michigan Stove Company are assisting their customers to advertise the Front Flue Oak Garland by furnishing them very artistic hangers, giving a fine representation of this Stove. These hangers consist of heavy paper, bound with brass at the top and bottom. A large cut of the Stove is shown, with the glow of the fire shining through the mica in the door. The special features of the Stove are perceived at a glance, but in order to impress its exceptional heat producing character on the observer a sectional view is given in a lower corner. The attractiveness of the hanger is enhanced by the addition of a domestic scene, two pretty children being depicted playing in front of the Stove and evidently enjoying its genial warmth. The Garland trade-mark appears in one corner of the hanger and the Michigan trade-mark in another. The various representations are appropriately colored.

Peter B. Acker, treasurer of the Union Stove Works, 70 Beekman street, New York City, expresses the following views relative to the Stove outlook : "The trade of this house is with every part of the United States, and we can say that there has been an immense improvement in the Western demand. There will be a still better state of things here next year, and we look for gradual improvement. When this is said it should be remembered that in the past three years 40 per cent. of the furnace and Stove manufacturers in this country have—mostly through necessity—gone out of business, there not having been trade enough to sustain them. We look for good business and can say that at present things are going along very nicely."

The Turner Heater Company, Bristol, Conn., advise us that their Positive Hot Air Furnace is meeting with a good sale, particularly in New England, and that it has stood every test made of it in a gratifying manner. This Heater has a number of special features which are set forth in a circular issued.

We are indebted to Charles H. Andrews & Co., 90 Canal street, Boston, Mass., managers of the New England sales department of the Reading Stove Works, Orr, Painter & Co., proprietors, Reading Pa., for a copy of the handsome catalogue issued by the concern named and reviewed at considerable length in these columns August 21 of the present year.

A representative of the Toledo *Blade* recently made a visit to the works of the Toledo Stove Company, at the corner of Smead and Grand avenues in that place, and in speaking about the condition of business J. Leonard, the secretary and treasurer, is reported to have said : "Look at those letters and telegrams just received, and you can imagine how this rot in some of the papers about there being no improvement in business makes us tired. We have had a very good trade all year ; three times as good as last year, and it is coming thicker and faster all the time. At the present time we are working full force, and our men are putting in overtime. We are turning out on an average 100 Stoves a day. The output depends upon

the kind of Stoves that are made. The small ones will run as high as 300 daily sometimes, but just now the demand is chiefly for Ranges and large Stoves. We are up to our eyes in work, and a number of our customers are telegraphing and writing us almost daily to hurry up their orders."

Edward P. Selden, secretary of the Erie City Iron Works, Erie, Pa., spent a portion of the year in Europe, and while in Amsterdam visited the public buildings which are occupied a part of the time as a palace by Her Majesty the Queen. In the throne room of the palace Mr. Selden noticed a Crown Jewel Heater, made by the Detroit Stove Works, Detroit, Mich. In a letter to the company he relates this incident of his visit, thinking that if the company were not aware of the use to which one of their Stoves had been put it would be a pleasant surprise to them.

Announcement is made that the Loewenberg & Going Company, proprietors of the Northwestern Stove Foundry, Portland, Ore., will in the future do both a jobbing and retail business. Mr. J. Loewenberg was the founder of the firm of Goldsmith & Loewenberg, but retired from active business some ten years ago. With a view, however, to fostering Portland trade in the large territory formerly under the control of the local concern, Mr. Loewenberg has again entered active business life in connection with the concern named. A full and complete line of Stoves and Ranges embracing new designs in steel Ranges and "air tights" will be carried in stock, as well as heavy lines of hollow ware, tinware, &c.

At a recent meeting of the Board of Directors of the Bridgeport Stove Works, Bridgeport, Ala., some changes were made in the management. Crawford Douglass resigned as president, being succeeded by F. R. Patterson, who since the organization of the company in 1892 had discharged the duties of secretary and treasurer. J. P. Seiter resigned as a director, his place on the Board being taken by F. R. Patterson.

In a recent interview with a representative of one of the Detroit papers, Charles E. Eames, head of the advertising department of the Detroit Stove Works, is reported to have made the following statements regarding the company's business: "We have been working night and day for three weeks past with a force of 1200 people. This is a somewhat larger force than we have employed before, but all through the hard times this concern were busy. We had a good year even last year. At the same time the demand for Jewel Stoves and Ranges is larger now than it has been in any previous year. During the past year there has been an increased demand for our goods in foreign markets. Within the past month we have made shipments to the Hawaiian Islands, South Africa, Belgium, Germany and Great Britain, and there is a steady demand for our goods in other foreign countries. Lately we received an inquiry concerning our Gas Stoves from the city of Milatore, Madras Presidency, South India. This inquiry came from a native high court pleader. Similar inquiries concerning our Gas Stoves have reached us from Italy and England. We have experienced considerable difficulty in getting transportation for our goods, but up to date have succeeded in making prompt shipments of all orders."

One of the papers at Sioux City, Iowa, speaking of the plant of what was once known as the Paris Stove Works at Leeds, states that a sort of funeral of the institution took place on the afternoon of October 9, when the contractor in charge of the destruction of the works pulled down the last remaining evidence of the plant. This was the big chimney, which stood 130 feet high and contained 140,000 bricks.

The Kentucky Stove Company of Louisville, Ky., have recently filed articles increasing their capital from $10,000 to $26,000.

C. H. Andrews & Co., managers of the New England sales department of the Reading Stove Works, Reading, Pa., have removed their offices to the Wakefield Building, 90 Canal street, and 71 Friend street, Boston, Mass.

The Yates Furnace Company, Lockport, N. Y., who were established 12 years ago under the management of Charles H. Yates, making a specialty of the Eclipse Furnace, state that there are 163 of them in that city and vicinity. In addition to the Furnace business they handle Stoves and do a tin and iron roofing business at 13 Cottage street.

The Turner Heater Company of Bristol, Conn., report that their plant is now running at its full capacity to meet the demand for their Turner and Positive Hot Air Furnaces. They have set in the city of Bristol 92 of these Furnaces and in neighboring towns they can be counted by the dozens.

In our issue of September 11 we referred to some of the city agencies appointed by the Fuller & Warren Company, Troy, N. Y., to handle their repairs. The reference to Joseph Huse & Son, Boston, Mass., gave the impression that they were limited to that city. As a matter of fact, however, they have been appointed the New England agents for the repairs of the Fuller & Warren Company, and are the sole and exclusive agents for the repairs for the territory specified. Huse & Son propose to carry in stock, as nearly as possible, a complete assortment of these repairs, and any which they may not happen to have they will order from the foundry.

The W. J. Loth Stove Company of Waynesboro, Va., are at present very busy filling orders for their specialties, prominent among which is their new sheet iron Wood Heater, known as the Magic. This Stove embraces many interesting features, and is neatly ornamented. The bottom, top and inside flues are of cast iron, and there is a cast iron feed hole cover hinged from the top so that when it is opened it stands perpendicularly and is at the same time out of the way. There is a wicket door under the bottom for cleaning out ashes, it being secured by means of wedge and lock buttons, thus making, it is claimed, a perfectly air tight joint. The body of the Stove is of polished steel lined with extra heavy sheet steel, securely fastened with bolts.

The Detroit Furnace & Heater Company of Detroit, Mich., are erecting new works to replace those recently destroyed by fire. The new plant will be of largely increased capacity, and with appliances and requirements of an up to date foundry for the manufacture of Peerless Furnaces.

The John Van Range Company, Cincinnati, Ohio, state that for the past 30 days they have been operating their works day and night to fill orders and the outlook for business the balance of the year is very promising. Several very large orders for installation in public institutions have been secured recently, while the demand for family sizes continues to be equally satisfactory. A number of additional hands have been put on.

Carlisle & Fisher, Hagerstown, Md., are heating the Academy of Music in their city by hot air, using two No. 6 Forbes Warm Air Furnaces.

The total output of nickel in 1896 was 4603 tons, of which Canada produced 1541 tons, New Caledonia 2972 tons and Norway 90 tons.

Director of the Philadelphia Museums Prof. W. P. Wilson announces the establishment of still another department, that of a laboratory. This department, which it was early expected might in time develop as a result of the museum's growth, has been at last rendered necessary by the constant and growing receipt of quantities of raw products, notably wool, silk and other textile fabrics, sent to the museum for study and analysis to determine their availability for American manufacturers. It is managed on the plans pursued abroad in similar great public museums and exhibitions, and it is claimed, and with good reason, that no other such laboratory exists in this country. Naturally enough the work of the laboratory will, as the circular shows, not be confined to textile fabrics, but will make tests of minerals of all kinds, building materials, cements and manufactured goods when presented. A schedule of charges is furnished in the circular, with full instructions as to selecting samples to be tested. The results of the testings will be certified to by the museum, will be held strictly confidential and are confidently expected to commend the workings of the museum's laboratory to American manufacturers.

The Oliver Wire Company of Pittsburgh recently broke the record for wire drawing in 24 hours. With the 24 hours ending at 6 a.m. Tuesday morning, October 26, this firm drew 1487 tons of wire, reckoned on one-hole drawing.

A queer strike recently occurred in a Western manufactory. Early in October the management of the company voluntarily announced an advance in wages of 10 per cent., to begin on the 25th. The employees were dissatisfied when they saw the date specified, and made a demand for the advance to begin two weeks earlier. They remained idle for ten days endeavoring to carry their point, when a compromise was effected fixing the date of the advance on the 18th. The workmen probably regard this as a victory, but they will have to be quite expert at figures to be able to calculate what they gained.

Workmen in Baltimore can factories are demanding an increase in wages from 15 to 20 cents per 100 cans.

The Edward Jones Tubing Company of Brooklyn, N. Y., have been incorporated, with a capital of $1800, to manufacture brass and metal tubing. The directors are Morris Salzman, Sigmund Siegelmann and Edward Jones of Brooklyn.

TRADE REPORT.

METAL MARKET.

Pig Tin.—Wholesale prices have weakened slightly under the influence of rather freer offering and general hesitancy on the part of buyers. A fairly good business has been effected during the week, mostly with consumers and dealers, but speculative interest remains positively dull, since there is no enlivening feature here or in the foreign markets. Jobbers' prices remain firm. Straits Pig, in small lots from store, is generally quoted at 14¾c. per lb. Arrivals of Pig Tin here, so far this month, have amounted to 2240 tons.

Copper.—The stand off between buyers and sellers that has been conspicuous for some little time past remains unbroken, and wholesale values are gradually weakening under the influence of more or less accumulation of stocks at primary points. Retail business has been of moderate proportions and jobbers' quotations are rather easier. In small parcels from store, Lake Ingot is quoted at 12c. to 12¼c. per lb., Ansonia grade Casting Copper at 11c. to 11¼c.

Sheet Copper.—A fair run of orders are being received for this material, but the demand is irregular and the total hardly up to the average for the season. Manufacturers in general are not quoting for deliveries extending beyond December 31, except at a premium over the current market rates for spot and near future shipments. For small lots of Sheet Copper from stock, jobbers ask about 15c. per lb. basis.

Pig Lead.—There has been only moderate business the past week, and wholesale prices have continued rather weak. No change has been made in retail prices, however, American Pig in small jobbing parcels being quoted at 4.35c. to 4½c. per lb.

St. Louis advices are as follows: The market for Pig Lead has failed to show any signs of recovery from the recent break. Consumers are evidently anticipating a still further decline, as they refuse to interest themselves in the market at the prices ruling to-day. The speculators have sold the market short and are doing their best to drive down prices, and the present condition of the market leads consumers to the belief that they will be successful.

Lead Pipe and Sheet.—As intimated in another column, the Eastern manufacturers have made a reduction of ¼c. in the pound on these materials. Lead Pipe is now quoted at 6c. and Sheet Lead at 7c., subject to the customary discount. The consumptive demand is disappointing in this quarter, and little improvement is looked for in the balance of the year.

Spelter.—The market remains in a quiet condition, but nothing more than ordinary competition develops, and prices have remained quite steady. Consumption is of quite moderate proportions. Good Western brands, in a retail way, rule at about 4.65c. to 4¾c. per lb.

St. Louis advices are as follows: There is no change to note in Spelter. Producers are nearly all asking 4.10c., and consumers are buying in moderate quantities at this price. There does not appear to be much chance for any change in the market price of this metal during the balance of the year.

Antimony.—There has been only routine trade and prices for small parcels have remained steady on the basis of 8¼c. to 8½c. for Cookson's, 7¾c. for Hallett's and 7½c. for Japanese.

Tin Plate.—The market has been exceedingly quiet and uninteresting during the entire week. The close of the canning season and the indifference of large consumers of Tin Plate in other lines has narrowed the demand to very small proportions. At the same time, the scarcity of spot stocks, caused by the difficulty the mills still labor under in regard to their Steel supplies, has prevented any quotable decline in prices. The fact that many of the mills are supplied with enough orders to keep them busy for several months ahead is a "bull" feature of the present situation. It is said that one of the very largest concerns in the business have all their product contracted for up to the end of April. Others have orders on their books for deliveries extending beyond the middle of next year. So that with even a moderately active demand no surplus stocks of any importance seem likely to come into sight for some time to come. It is probable that the present indifference of some of the large consumers is due to the news of the large additions to the producing force now being started. They expect this radical increase in production will bring about keener competition among the makers, resulting in lower prices. But it is pointed out that most of the new mills are not likely to be in operation and turning out goods for the market before the middle, or perhaps the second half, of next year. They would not, in consequence, cut any material figure in the 1898 market. Moreover, it is a debatable point whether the capacity of the American mills is, at the present time, quite equal to the home demand. With the increase in consumption expected next year there would seem to be room, therefore, for quite a few more mills in the industry. The retail trade has been comparatively tame the past week, especially in the line of Roofing Plates. Quotations on moderate sized lots of American Plates for spot delivery at New York, Philadelphia and Baltimore are about as follows: American Coke Tins IC, 108 lbs, 14 x 20, Bessemer Steel, $3.50 to $3.60; do., 100 lbs., $3.40 to $3.50; do., 95 lbs., $3.35 to $3.45; do., 90 lbs, $3.30 to $3.40; American Charcoal Brights, Melyn Grade, IC, 14 x 20, $4.75; Allaway grade, IC, 14 x 20, $4.25; American Charcoal Ternes, IC, 14 x 20, ordinary, $3.50 to $3.60. Foreign Plates have been very quiet and prices are without change.

Chicago advices are as follows: A singular state of affairs obtains in this branch. Consumers and jobbers cannot get satisfactory shipments from the mills, which are crowded with orders, yet prices are not strong.

A special London cable dispatch of October 27, 1897, reports on the British Tin Plate market as follows: Tin Plate for prompt delivery continues in light demand, but makers are fairly booked and not pressing sales. Concessions in wages are not affecting prices at the moment, but buyers hold off in expectation of lower figures and refuse to contract for forward delivery. Any advantage that there might be in the reduction of workmen's wages is counteracted, however, by dearer prices for Tin Plate Bars. The Tin Plate Workers' Union has decided to accept 15 per cent. reduction off the '74 list, commencing November 1. The stocks at shipping ports have increased to 164,000 boxes.

Sheet Iron.—Business is quite active in this line and mills are busy, especially on orders for Thin Sheets. Prompt shipments are difficult to get and prices are rather higher. It is said that fully 90 per cent. of the Black Sheet manufacturers have signified their intention to maintain the prices agreed upon at the meeting held in Pittsburgh on October 7, and several of the largest mills state that they have entered within the last week quite a number of orders based on those prices. The demand for Galvanized Sheets, while not so good relatively as for Black Sheets, is referred to as active. Jobbers' prices in this section for small quantities are quoted at 2.35c. to 2.40c. per lb. for No. 27 Common Black Iron and 75 and 10 and 5 per cent. off the list for Galvanized Sheets.

Chicago advices are as follows: A much better business is doing in Black Sheets than in Galvanized. A number of large consumers appear to have estimated their requirements below their actual needs and are purchasing additional quantities. On No. 28 the manufacturers are experiencing some little competition from the Tin Plate mills. The manufacturers of Galvanized Sheets are full of work. Small lots from stock are selling at 2.30c. for No. 27 Black and 80 per cent. off for Galvanized.

Old Metals.—The market is rather more quiet, the demand not being as brisk as it was last week. Prices, however, are well maintained. Dealers in this city and vicinity pay about the following rates for moderate sized lots, delivered here:

Heavy Copper	per lb. 9 c.
Light and Tinned Copper	per lb. 8 c.
Heavy Brass	per lb. 5¼c.
Light Brass	per lb. 4¼c.
Lead	per lb. 3¼c.
Tea Lead	per lb. 2¾c.
Zinc	per lb. 2 c.
No. 1 Pewter	per lb. 8 c.
No. 2 Pewter	per lb. 4½c.
Wrought Scrap Iron, per gross ton	$10.00 to $10 50
Heavy Cast Scrap, per gross ton	$9.00 to 9.50
Stove Plate Scrap, per gross ton	5.50
Burnt Iron, per gross ton	4.50

THE IRON MARKET.

The past week has been an uneventful one so far as the cruder materials, Pig Iron and Steel, are concerned. The salient fact is that the active furnaces, Steel works and rolling mills are crowded for deliveries, which proves that current consumption is heavy. It is the fear that it may possibly decrease as we draw near the close of the year which is causing some uneasiness to those with whom the experience of former winter seasons is still fresh.

Telling against this influence is, first, the very comfortable situation in which sellers find themselves now. Any efforts to market product for distant delivery meet the danger that cost of production will probably show an advancing tendency. Even now Connellsville Coke has sold for this year's delivery at $1.75.

In the Central West the drought in the Connellsville Coke region is beginning to cause some uneasiness, since it may very seriously affect the Coke supply if it continues.

In the Wire trade there are indications that the season is drawing to a close, and prices are weaker. The export trade is quiet.

Pig Iron.—The market in New York has been very quiet during the past week, but remains steady. Some round lots of Warrants have been offered at concessions. There have been reports that the agreement of the Eastern Pig Iron makers is not being lived up to strictly in all cases. We quote as follows: Northern brands, No. 1, $11.75 to $12; No. 2, $11.25 to $11.50; No. 2 Plain, $10.75 to $11. Southern brands, same delivery: No. 1, $11 to $11.25; No. 2, $10.50 to $10.75; No. 1 Soft, $11 to $11.25; No. 2, $10.75 to $11.

In the Philadelphia market for Pig Iron business is not as active as it was earlier in the month, but furnaces are well sold ahead, and as the Iron is promptly taken there is a feeling of confidence in values that is very reassuring. So far as known, no Iron can be bought for less than the inside quotations of the past two weeks, while sales at 25c. better are not at all exceptional. As regards new business, it cannot be said that there is a heavy demand, but it is a long time since deliveries were called for with such urgency as they are to-day. The situation must therefore be regarded as unusually favorable, and unless something very unforeseen occurs prices are not likely to go much if anything below their present level. General quotations for seaboard deliveries are about as follows, with the usual freight differences at points within 100 miles south or west: No. 1 X Foundry, $12 to $12.50; No. 2 X Foundry, $11.25 to $11.75; No. 2 Plain, $10.75 to $11.

Only a moderate demand is reported by the local producers of Pig Iron in the Chicago district, but it keeps the furnaces busy to supply it. Sales are mainly of small quantities, the largest contract recently taken calling for 1000 tons, yet the aggregate of the week's business is reported fully up to the shipments. The demand comes from all classes of foundries. Southern Iron, on the contrary, is much quieter. Sales are far apart and inquiries have lately been very few. The furnace companies, however, are reported to be well sold up and the lack of demand from this locality is not expected to result in any weakness of prices. We quote for cash as follows:

Lake Superior Charcoal	$12.50 to $13.00
Local Coke Foundry, No. 1	11.50 to 12.00
Local Coke Foundry, No. 2	11.00 to 11.50
Local Coke Foundry, No. 3	10.50 to 10.75
Local Scotch, No. 1	11.50 to 12.25
Ohio Strong Softeners, No. 1	12.00 to 12.25
Southern Silvery	11.25 to 11.50
Southern Coke, No. 1	11.00 to 11.25
Southern Coke, No. 2	10.60 to 11.00
Southern Coke, No. 3	10.35 to 10.60
Southern, No. 1 Soft	11.00 to 11.25
Southern, No. 2 Soft	10.60 to 11.00

The demand for Pig Iron generally in the Pittsburgh market is quiet. Bessemer Pig is a shade higher and Foundry Irons are in better demand. Quotations are as follows, f.o.b. cars Pittsburgh: No. 1 Foundry, $11 to $11.25; No. 2, Foundry, $10.50 to $10.75; No. 3 Foundry, $10 to $10.25; Bessemer, $10.40 to $10.50.

Things have taken an easy and quiet course in the Cincinnati Pig Iron market during the past week. Large deals have been very scarce, and while there has been a moderate number of small orders yet the tonnage has been light. Consumers, however, are all active and an increasing amount of Iron is being melted. There are but few who now expect another buying movement in Pig Iron circles before December, for nearly all buyers, especially the larger ones, are well supplied for the remainder of the present year. Prices are about as they were a week ago. Furnaces generally hold to the outside quotations quite firmly. There is still some warrant Iron and an occasional offering by some furnace in need of cash at the inside figures. On the whole, the market closes unchanged and firm. Quotations are as follows, f.o.b. Cincinnati:

Southern Coke, No. 1	$10.00 to .....
Southern Coke, No. 2	9.50 to $9.75
Southern Coke, No. 3	9.00 to 9.50
Southern Coke, No. 1 Soft	9.75 to 10.00
Southern Coke, No. 2 Soft	9.50 to 9.75
Southern Coke, Gray Forge	9.00 to 9.25
Southern Coke, Mottled	9.00 to .....
Ohio Silvery, No. 1	12.75 to 13.00
Ohio Silvery, No. 2	12.00 to 12.25
Lake Superior Coke, No. 1	11.00 to 11.50
Lake Superior Coke, No. 2	10.50 to 11.00
Tennessee Charcoal, No. 1	13.00 to 13.25
Tennessee Charcoal, No. 2	11.50 to 12.00

The Pig Iron market in St. Louis has been quiet during the past week. Sales that have been made were mostly confined to warrant Iron, which is being offered at about 25c. per ton less than regular brands. Prices are being firmly maintained by furnaces, who show no disposition to shade prices to secure business. Stocks on the furnace banks continue to show a steady decline, which in the case of the largest Southern producers will amount to nearly 30 per cent. decrease in the past 30 days, with sufficient orders on their books to take care of their output during the next six months. The market is in excellent condition, and if present prices are maintained until the turn of the year it seems almost a certainty that higher prices will prevail after that time. We quote as follows for cash, f.o.b. cars St. Louis:

Southern, No. 1 Foundry	$10.50 to $11.00
Southern, No. 2 Foundry	10.25 to 10.50
Southern, No. 3 Foundry	10.00 to 10.25
No. 1 Soft	10.25 to 10.50
No. 2 Soft	10.00 to 10.25

CHICAGO REPORT.

Scrap.—The demand for all kinds of old material is very good. More rolling mills are starting in the West, which will largely increase the consumption. Yard dealers' buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
Country Wrought Scrap	$7.50	....
Machinery Cast	7.00	....
Malleable Cast	6.50	....
Stove Plate (free of burnt)	5.00	....
Burnt Iron and Grate Bars	3.00	....
Sheet Iron and Hoops	2.00	....
Plow Steel and Breaking Stock	5.00	....
No. 2, such as Shovels, Hoes, &c	2.50	....
Old Boilers—whole (Iron)	3.00	....
Old Boilers (Iron)—cut in single Sheets and Rings	7.00	....
Old Gas Pipe and Boiler Tubes	6.00	....
Cast Borings	3.00	....
Turnings	4.00	....
Horseshoes	9.50	....
Copper Wire and Heavy	....	10 c.
Copper Bottoms	....	9 c.
Copper Clips	....	9¾c.
Red Brass	....	8 c.
Yellow Brass	....	7 c.
Light Brass	....	4 c.
Pipe Lead	....	3.60c.
Tea Lead	....	3 c.
Zinc	....	3¼c.
Rubber	....	4 c.
Inside Bicycle Tubing	....	10 c.
Outside Tubing	....	3½c.
Rubber Hose	....	¾c.

Anthracite.—A heavier trade is doing with trans-Mississippi points than nearer at home. The mildness of the weather has served to make business unusually backward for the season. The price on carload lots of 12 tons minimum is now as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.35	$5.60
Milwaukee, Wis	5.35	5.60
Kansas City, Mo	7.35	7.60
Council Bluffs, Iowa	7.35	7.60
Lincoln, Neb	7.50	7.75
Sioux City, Iowa	7.85	8.10
Aberdeen, S. Dak	8.60	8.85
Dubuque, Iowa	6.65	6.90
Madison, Wis	6.85	7.10
St. Paul, Minn	7.85	8.10
Burlington, Iowa	6.85	7.10
Des Moines, Iowa	7.35	7.60
Davenport, Iowa	6.65	6.90
St. Joseph, Mo	7.35	7.60
Leavenworth, Kan.	7.35	7.60
Omaha, Neb	7.35	7.60

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$6.50
Pueblo	6.50
Colorado Springs	6.50
Leadville	6.50
Cheyenne, Wyo	7.50
All points between Denver and Missouri River	7.00

The contract has been placed for the large new trade school to be built for the Baron de Hirsch Fund at Sixty-fourth street and Third avenue, New York City.

THE HARDWARE TRADE.

The advance of the season and the advent of cold weather in the West and Northwest have had the effect of stimulating trade in winter goods, and an excellent demand is reported by many of the jobbers, retailers having deferred purchasing as long as they could. The condition of things in the South makes it especially desirable that cold weather set in to check the spread of the fever, apprehension of which has interfered to some considerable extent with business. Throughout the country generally there is a fair trade in progress, but the improved conditions have not as yet affected the consumers of goods sufficiently to put them in a position to buy freely. The money realized from agricultural products, the gradual increase in the activity of factories and the enlargement of enterprise in many directions are, however, putting the working classes in a much better position than for a long time, and there is little doubt that the basis is being laid for renewed and continued prosperity. Meanwhile the demand continues fair, the jobbing houses in some sections being busily engaged with the many orders coming in to them from their travelers or direct from their customers. Manufacturers, too, unite in reporting a much more promising condition of things than they have experienced in recent years, and the trade generally are looking forward to a fair trade during the remainder of the year, in the expectation that after that there will be more marked improvement, when business men generally will reap in fuller measure the advantages resulting from existing improved conditions. In the matter of prices there is little new to report. The general range of values remains without change, some goods being a little higher and others receding somewhat. In several lines the jobbers are cutting prices somewhat more freely than of late, particularly in goods which have advanced, their purchases at lower prices than are now current enabling them to do this.

Advices from Chicago.—Shelf Hardware jobbers report perhaps a better volume of business than usual at this time of the year, but the heavy fall demand is now over and the orders being received are for small lots to stock up and for such classes of seasonable goods as are appropriate to this period. A good movement is still noted in Builders' Hardware, but the demand for staple goods, such as Wire Nails and Barb Wire, is considerably lighter than it has been. The general demand for metals is rather quiet, but quite an active movement is noted in the smaller goods in the line of Tinware. Factories are behind in their shipments of such goods, as they are unable to get Tin Plate fast enough. More full packages are now going out and the demand is running to goods of better quality. The prolonged dry weather has been beneficial to the jobbers of Heavy Hardware, as it has caused an unusual demand for Wagon and Carriage Tire, Spokes and Rims. The business of the month has been very heavy, orders still keeping up, the gains this week being as large as at any time in October.

Advices from St. Louis.—The Hardware trade continues to feel the effects of the late summer, which is prolonged to an unusual degree. The month of November is right at hand and furnace fires have not as yet been lighted. Dealers in Stoves and kindred supplies bought liberally in anticipation of a heavy demand, but as yet have had practically no business to speak of. The demand for Shelf Goods is moderately active and Heavy Hardware is also in good demand. Prices are firm and in some cases advances have been made. Galvanized Iron is now quoted at 80 and 2½ per cent. discount. Screws have advanced and Flat Head Iron Screws are now quoted at 90, 10 and 5 per cent. discount. The general trend of prices is upward, and in view of the advance in raw material a general advance throughout the entire line of finished products is in order. Collections are very satisfactory.

NOTES ON PRICES.

Wire Nails.—The demand for Wire Nails is not quite so active as it was a month ago, but the market continues to be in excellent condition, with prices quite firmly maintained by the manufacturers. Some of the jobbers, however, who purchased freely at lower prices are cutting somewhat. New York quotations are $1.70 for small lots from store.

Advices from Chicago.—Manufacturers are as firm as at any previous time this fall. Rods are still scarce and dear. Owing to the efforts of some local middlemen, however, to unload Nails which they were obliged to take this month, the market seems a trifle easier. This influence is only expected to be temporary and may be confined entirely to this immediate locality. Jobbers quote small lots from stock at $1.60 to $1.65.

Advices from St. Louis.—There is no change to note in Wire Nails. The demand is satisfactory, and prices are well maintained. Jobbers quote $1.65 to $1.70 base for small lots from store.

Cut Nails.—The market continues fairly active, with prices firmly maintained. The New York price is $1.53 for less than carload lots.

Advices from Chicago.—Not much is heard of Cut Nails in this market. Prices for small lots are continued at $1.50 to $1.55.

Advices from St. Louis.—There is a fair amount of business doing in Cut Nails. Less than carload lots command $1.55.

Barb Wire.—The Barb Wire market is quiet, with prices steady.

Advices from Chicago.—The factories are still busy on contracts which they have taken for shipment this fall, but new business is not now coming forward to any considerable extent. The demand is about over for this season. The outlook for the spring trade is pronounced on all sides to be exceedingly satisfactory. Small lots from stock sell at $1.60 for Painted and $1.90 for Galvanized.

Advices from St. Louis.—There has been a steady falling off in the demand for Barb Wire, and as the dull season is rapidly approaching mills do not anticipate a revival of trade until the spring demand sets in. Jobbers quote small lots of Painted at $1.65 to $1.70, with the usual advance for Galvanized.

Smooth Wire.—There is no change of importance in the market for Smooth Wire. A fair but not especially heavy volume of business is reported.

Lead Pipe and Sheet Lead.—Under date October 22 the following revised prices on Lead Pipe and Sheet Lead are announced, which are subject to the usual discount of 20 per cent.:

Lead Pipe	per lb., 6 cents.
Sheet Lead	" 7 "

Wrought Iron Pipe.—The arrangement between the manufacturers of Wrought Iron Pipe is working satisfactorily, and prices are quite steady on the new basis. The policy recently adopted by the manufacturers of giving delivery on carload lots and making less than carload lots f.o.b. factory is referred to as working satisfactorily and giving the large trade more protection on this line. The volume of business is fair, but not especially heavy. The base prices are as follows: Butt Welded Black, 72 per cent.; Butt Welded Galvanized, 67 per cent.; Lap Welded Black, 78 per cent.; Lap Welded Galvanized, 70 per cent.

Registers.—There continues to be some confusion in the trade owing to the fact that some of the manufacturers are using the old and some the new list on Registers. There is also considerable diversity in the prices at which the goods are sold.

Tacks.—The Tack market is characterized by a somewhat firmer tone, some of the manufacturers having either announced higher prices or withdrawn outstanding quotations. The advance in the raw material and the increased demand are reasons for this action. There is, however, a good deal of unevenness in the market, and the quotations of the different manufacturers on similar goods in many cases vary widely.

Sheet Aluminum.—The November price-list of the Pittsburgh Reduction Company, Pittsburgh, Pa., shows a reduction in the price of the heavier gauges of Sheet Aluminum from No. 19 to No. 13 gauge, wider than 6 inches and including 14 inches, from 40 cents per pound to 38 cents per pound. All the other prices remain as given in the new list published on page 86 of *The Metal Worker* of October 16, 1897. It is pointed out that the present reduction brings the cost of Sheet Aluminum below the cost of Sheet Brass of similar size and gauge.

Carriage Bolts, Machine Bolts, &c.—An advance of about 5 per cent. has been announced by most of the manufacturers of Carriage Bolts, Machine Bolts, Lag Screws, &c. This is referred to as necessary on account of the increased cost of the raw material. While there is no formal agreement between the manufacturers in regard to prices, most of them are working harmoniously, and the market is thus in a better condition than it was a short time ago. There is, however, still some irregularity in prices.

Nuts.—At a conference of some of the manufacturers of Hot Pressed Nuts held last week it was decided to make an advance of 1-10 cent per pound. No change was made in price of Cold Punched Nuts.

Glass.—Jobbers have received no notification of the new association—the American Glass Company—being in operation, nor have any new price-list or discounts gone into effect. It is therefore safe to assume that the details

have not all been perfected and that the single association is not yet in working order. Chicago jobbers have recently advanced prices 5 per cent., and another advance will go into effect, it is understood, November 1. A committee has also been appointed to arrange, if possible, a temporary consolidation of all the jobbers' stocks, to be distributed by one selling agent in such a way as to supply the most urgent needs of consumers. If this deal is carried into effect it will, of course, do away with competition and insure the best price obtainable. New York jobbers' stocks are well assorted, not having been depleted because of the lack of demand. The nominal quotation on American Glass is 60 and 10 and 5, and on French—from the new list—80 and 20 per cent. Competition and desire for business result in concessions from these prices being made.

White Lead.—There has been about the ordinary distribution of White Lead and by-products, and despite the unsettled condition of the market for base material corroders have made no changes in their list prices or terms. There is still some indirect swerving on the part of jobbers, however, and ordinary small orders are being taken at almost the net price made officially for large lots.

Linseed Oil.—Prices have been very steady throughout the week, and the market is without really new feature. Crushers are more than usually conservative, owing to the condition of the Seed market, and buyers are placing orders only as immediate wants may require.

Spirits Turpentine.—Southern markets have weakened and wholesale prices are lower here in sympathy.

TRADE NOTES.

Articles of incorporation of the Safety Burner Company of Providence, R. I., have been filed at the office of the Secretary of State of Rhode Island. The company have been formed for the manufacture and sale of Lamp Burners and other articles of a similar nature and Novelties. The incorporators are Isaiah Long, Alfred S. Keach and William H. Sweetland. The amount of capital stock is stated at $50,000.

The Levi Hey Company of Rochester, N. Y., have been incorporated, with a capital stock of $40,000, to deal in Rags, Paper Stock, Iron, Steel and other metals. The directors named are Levi Hey, Ernest C. Hazard, George R. Coates and John Bennett of Rochester.

MEMORANDA.

Wilson & Co. have opened up a large Hardware store at 162 Pennsylvania avenue, Allegheny, Pa. The firm are handling Stoves, Tinware and House Furnishing Goods, and also have a steam, hot water and warm air heating and ventilation department.

Landers, Frary & Clark, New Britain, Conn., have recently enlarged their line of raisin seeders by adding the No. 3 Crown seeder, said to seed a pound of raisins in one minute. This size is designed for bakeries, hotels, clubs, restaurants and other places of similar character. A No. 4 size for family use, made on the same principle, is also offered. This is said to seed 1 pound of raisins in five minutes. The Nos. 1 and 2 Crown raisin seeders brought out last fall complete the assortment of seeders made by this company. Another comparatively new line are the Crown coffee mills, seven in number, two with cranks and five with double fly wheels, listing from $1.50 to $16 each, grinding from 6 ounces a minute to 1½ pounds in the same time.

The Knapp & Cowles Mfg. Company, Bridgeport, Conn., have lately put on the market No. 2 family cleaver, which is described as made of the best cast steel, forged, with finely polished handle and heavy steel ferrule. Its construction is referred to as insuring a perfect balance. Another article which they have recently commenced manufacturing is a magnetic tack hammer.

H. C. Strong, Port Angeles, Wash., has taken Robert D. Willson into partnership in his Hardware business. The style is now Strong & Willson. The firm have secured the store adjoining their establishment, and will put a stock of House Furnishing Goods in it. The Alaska gold excitement and the prosperity of the local farmers are mentioned as insuring a bright future for Puget Sound merchants.

W. Willet Trego has purchased the Hardware business formerly conducted by F. A. Schneider, at 1763 Pennsylvania avenue N. W., Washington, D. C., and will continue at the old stand. Mr. Trego would be pleased to receive printed matter relating to the Hardware and House Furnishing Goods lines.

Foard & Stokes Company, Astoria, Oregon, who have been in business at that point for the past 17 years, advise us that their trade has increased to such an extent that they have leased the upper story of the building they are now occupying, which will give them another floor, 50 x 75 feet. This floor will be devoted to the sample and display of their stock of Hardware, Crockery, Stoves and Tinware. An electric elevator will also be installed, which will facilitate the moving of goods from one floor to another. The company are also dealers in a full line of Ship Candlery, Paints, Oils, Wood and Willow Ware, Cannery and Fishing Supplies, &c.

Hibbard, Spencer, Bartlett & Co., Lake street and Wabash avenue, Chicago, have secured exclusive control of the output of Ajax and Alaska metallic stitched weather strip. These are two styles of metallic weather strip, but both of them are claimed to be the only ones ever produced in which the rubber is secured to the metal by teeth. These teeth number ten to the inch along the edge of the zinc strip, are punched through the rubber and are clinched on the other side. The zinc is corrugated, so that it is very stiff when tacked in position through holes punched 2½ inches apart. Both forms of the strip are put up in very attractive and convenient packages, namely, rolled in coils in lengths of 100 feet and placed in flat boxes, the end pulling out straight at a corner of the box. The method of packing makes great saving in shelf room, and is in itself sufficient to sell the goods.
